This function will insert a copy of the given rvalue before the specified location. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 1049 of file stl_list.h.

5.534.3.24 `template<typename _Tp, typename _Alloc> list<_Tp, _Alloc>::iterator list::insert (iterator __position, const value_type & __x)`

Inserts given value into list before specified iterator.

Parameters

position An iterator into the list.

x Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 98 of file list.tcc.

References `std::list<_Tp, _Alloc>::_M_create_node()`.

Referenced by `std::list<_Tp, _Alloc>::operator=()`, and `std::list<_Tp, _Alloc>::resize()`.

5.534.3.25 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list<_Tp, _Alloc>::insert (iterator __p, initializer_list<value_type> __l) [inline]`

Inserts the contents of an [initializer_list](#) into list before specified iterator.

Parameters

p An iterator into the list.

l An [initializer_list](#) of value_type.

This function will insert copies of the data in the [initializer_list](#) *l* into the list before the location specified by *p*.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

Definition at line 1066 of file stl_list.h.

References `std::list<_Tp, _Alloc>::insert()`.

Referenced by `std::list<_Tp, _Alloc>::insert()`.

5.534.3.26 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::insert (iterator __position, size_type
__n, const value_type & __x) [inline]`

Inserts a number of copies of given data into the list.

Parameters

position An iterator into the list.

n Number of elements to be inserted.

x Data to be inserted.

This function will insert a specified number of copies of the given data before the location specified by *position*.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

Definition at line 1083 of file stl_list.h.

5.534.3.27 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator > void std::list< _Tp,
_Alloc >::insert (iterator __position, _InputIterator __first,
_InputIterator __last) [inline]`

Inserts a range into the list.

Parameters

position An iterator into the list.

first An input iterator.

last An input iterator.

This function will insert copies of the data in the range [*first,last*) into the list before the location specified by *position*.

This operation is linear in the number of elements inserted and does not invalidate iterators and references.

Definition at line 1104 of file stl_list.h.

5.534.3.28 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
size_type std::list< _Tp, _Alloc >::max_size () const [inline]`

Returns the [size\(\)](#) of the largest possible list.

Definition at line 838 of file stl_list.h.

5.534.3.29 `template<typename _Tp , typename _Alloc > void list::merge (list< _Tp, _Alloc > && __x)`

Merge sorted lists.

Parameters

x Sorted list to merge.

Assumes that both *x* and this list are sorted according to operator<(). Merges elements of *x* into this list in sorted order, leaving *x* empty when complete. Elements in this list precede elements in *x* that are equal.

Definition at line 287 of file list.tcc.

References std::list< _Tp, _Alloc >::begin(), std::begin(), std::list< _Tp, _Alloc >::end(), and std::end().

Referenced by std::list< _Tp, _Alloc >::sort().

5.534.3.30 `template<typename _Tp , typename _Alloc > template<typename _StrictWeakOrdering > void list::merge (list< _Tp, _Alloc > && __x, _StrictWeakOrdering __comp)`

Merge sorted lists according to comparison function.

Parameters

x Sorted list to merge.

StrictWeakOrdering Comparison function defining sort order.

Assumes that both *x* and this list are sorted according to StrictWeakOrdering. Merges elements of *x* into this list in sorted order, leaving *x* empty when complete. Elements in this list precede elements in *x* that are equivalent according to StrictWeakOrdering().

Definition at line 321 of file list.tcc.

References std::list< _Tp, _Alloc >::begin(), std::begin(), std::list< _Tp, _Alloc >::end(), and std::end().

5.534.3.31 `template<typename _Tp , typename _Alloc > list< _Tp, _Alloc > & list::operator= (const list< _Tp, _Alloc > & __x)`

List assignment operator.

No explicit dtor needed as the _Base dtor takes care of things. The _Base dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Parameters

x A list of identical element and allocator types.

All the elements of *x* are copied, but unlike the copy constructor, the allocator object is not copied.

Definition at line 184 of file list.tcc.

References std::list< _Tp, _Alloc >::begin(), std::list< _Tp, _Alloc >::end(), std::list< _Tp, _Alloc >::erase(), and std::list< _Tp, _Alloc >::insert().

5.534.3.32 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
list& std::list< _Tp, _Alloc >::operator= (initializer_list<
value_type > __l) [inline]`

List initializer list assignment operator.

Parameters

l An [initializer_list](#) of value_type.

Replace the contents of the list with copies of the elements in the [initializer_list](#) *l*. This is linear in l.size().

Definition at line 652 of file stl_list.h.

5.534.3.33 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
list& std::list< _Tp, _Alloc >::operator= (list< _Tp, _Alloc > &&
__x) [inline]`

List move assignment operator.

Parameters

x A list of identical element and allocator types.

The contents of *x* are moved into this list (without copying). *x* is a valid, but unspecified list

Definition at line 635 of file stl_list.h.

5.534.3.34 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::pop_back () [inline]`

Removes last element.

This is a typical stack operation. It shrinks the list by one. Due to the nature of a list this operation can be done in constant time, and only invalidates iterators/references to the element being removed.

Note that no data is returned, and if the last element's data is needed, it should be retrieved before `pop_back()` is called.

Definition at line 1001 of file `stl_list.h`.

5.534.3.35 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list<_Tp, _Alloc>::pop_front () [inline]`

Removes first element.

This is a typical stack operation. It shrinks the list by one. Due to the nature of a list this operation can be done in constant time, and only invalidates iterators/references to the element being removed.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop_front()` is called.

Definition at line 961 of file `stl_list.h`.

References `std::begin()`.

5.534.3.36 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list<_Tp, _Alloc>::push_back (const value_type & __x
) [inline]`

Add data to the end of the list.

Parameters

`x` Data to be added.

This is a typical stack operation. The function creates an element at the end of the list and assigns the given data to it. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 975 of file `stl_list.h`.

References `std::end()`.

5.534.3.37 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list<_Tp, _Alloc>::push_front (const value_type & __x
) [inline]`

Add data to the front of the list.

Parameters

x Data to be added.

This is a typical stack operation. The function creates an element at the front of the list and assigns the given data to it. Due to the nature of a list this operation can be done in constant time, and does not invalidate iterators and references.

Definition at line 934 of file stl_list.h.

References std::begin().

5.534.3.38 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>>
reverse_iterator std::list< _Tp, _Alloc >::rbegin () [inline]`

Returns a read/write reverse iterator that points to the last element in the list. Iteration is done in reverse element order.

Definition at line 754 of file stl_list.h.

References std::end().

5.534.3.39 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>>
const_reverse_iterator std::list< _Tp, _Alloc >::rbegin () const
[inline]`

Returns a read-only (constant) reverse iterator that points to the last element in the list. Iteration is done in reverse element order.

Definition at line 763 of file stl_list.h.

References std::end().

5.534.3.40 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>>
void std::list< _Tp, _Alloc >::remove (const _Tp & __value)`

Remove all elements equal to value.

Parameters

value The value to remove.

Removes every element in the list equal to *value*. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

5.534.3.41 `template<typename _Tp, typename _Alloc> template<typename
_Predicate> void list::remove_if (_Predicate __pred)`

Remove all elements satisfying a predicate.

Parameters

Predicate Unary predicate function or object.

Removes every element in the list for which the predicate returns true. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 391 of file list.tcc.

References `std::list< _Tp, _Alloc >::begin()`, and `std::list< _Tp, _Alloc >::end()`.

5.534.3.42 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::list< _Tp, _Alloc >::rend () const
[inline]`

Returns a read-only (constant) reverse iterator that points to one before the first element in the list. Iteration is done in reverse element order.

Definition at line 781 of file stl_list.h.

References `std::begin()`.

5.534.3.43 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reverse_iterator std::list< _Tp, _Alloc >::rend () [inline]`

Returns a read/write reverse iterator that points to one before the first element in the list. Iteration is done in reverse element order.

Definition at line 772 of file stl_list.h.

References `std::begin()`.

5.534.3.44 `template<typename _Tp, typename _Alloc> void list::resize (
size_type __new_size, const value_type & __x)`

Resizes the list to the specified number of elements.

Parameters

new_size Number of elements the list should contain.

x Data with which new elements should be populated.

This function will resize the list to the specified number of elements. If the number is smaller than the list's current size the list is truncated, otherwise the list is extended and new elements are populated with given data.

Definition at line 153 of file list.tcc.

References std::list< _Tp, _Alloc >::begin(), std::list< _Tp, _Alloc >::end(), std::list< _Tp, _Alloc >::erase(), and std::list< _Tp, _Alloc >::insert().

5.534.3.45 **template<typename _Tp, typename _Alloc > void list::resize (size_type __new_size)**

Resizes the list to the specified number of elements.

Parameters

new_size Number of elements the list should contain.

This function will resize the list to the specified number of elements. If the number is smaller than the list's current size the list is truncated, otherwise default constructed elements are appended.

Definition at line 138 of file list.tcc.

References std::list< _Tp, _Alloc >::begin(), std::list< _Tp, _Alloc >::end(), and std::list< _Tp, _Alloc >::erase().

5.534.3.46 **template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list< _Tp, _Alloc >::reverse () [inline]**

Reverse the elements in list.

Reverse the order of elements in the list in linear time.

Definition at line 1402 of file stl_list.h.

5.534.3.47 **template<typename _Tp, typename _Alloc = std::allocator<_Tp>> size_type std::list< _Tp, _Alloc >::size () const [inline]**

Returns the number of elements in the list.

Definition at line 833 of file stl_list.h.

References std::begin(), __gnu_cxx::distance(), and std::end().

5.534.3.48 `template<typename _Tp, typename _Alloc > void list::sort ()`

Sort the elements.

Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.

Definition at line 353 of file list.tcc.

References `std::list< _Tp, _Alloc >::begin()`, `std::list< _Tp, _Alloc >::empty()`, `std::list< _Tp, _Alloc >::merge()`, `std::list< _Tp, _Alloc >::splice()`, and `std::list< _Tp, _Alloc >::swap()`.

5.534.3.49 `template<typename _Tp, typename _Alloc > template<typename _StrictWeakOrdering > void list::sort (_StrictWeakOrdering __comp)`

Sort the elements according to comparison function.

Sorts the elements of this list in NlogN time. Equivalent elements remain in list order.

Definition at line 430 of file list.tcc.

References `std::list< _Tp, _Alloc >::begin()`, `std::list< _Tp, _Alloc >::empty()`, `std::list< _Tp, _Alloc >::merge()`, `std::list< _Tp, _Alloc >::splice()`, and `std::list< _Tp, _Alloc >::swap()`.

5.534.3.50 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> void std::list< _Tp, _Alloc >::splice (iterator __position, list< _Tp, _Alloc > && __x, iterator __first, iterator __last) [inline]`

Insert range from another list.

Parameters

position Iterator referencing the element to insert before.

x Source list.

first Iterator referencing the start of range in *x*.

last Iterator referencing the end of range in *x*.

Removes elements in the range `[first,last)` and inserts them before *position* in constant time.

Undefined if *position* is in `[first,last)`.

Definition at line 1268 of file `stl_list.h`.

5.534.3.51 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::splice (iterator __position, list<
_Tp, _Alloc > && __x, iterator __i) [inline]`

Insert element from another list.

Parameters

position Iterator referencing the element to insert before.

x Source list.

i Iterator referencing the element to move.

Removes the element in list *x* referenced by *i* and inserts it into the current list before *position*.

Definition at line 1232 of file stl_list.h.

5.534.3.52 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::splice (iterator __position, list<
_Tp, _Alloc > && __x) [inline]`

Insert contents of another list.

Parameters

position Iterator referencing the element to insert before.

x Source list.

The elements of *x* are inserted in constant time in front of the element referenced by *position*. *x* becomes an empty list.

Requires this != *x*.

Definition at line 1202 of file stl_list.h.

References std::list< _Tp, _Alloc >::begin(), std::list< _Tp, _Alloc >::empty(), and std::list< _Tp, _Alloc >::end().

Referenced by std::list< _Tp, _Alloc >::sort().

5.534.3.53 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::list< _Tp, _Alloc >::swap (list< _Tp, _Alloc > & __x)
[inline]`

Swaps data with another list.

Parameters

x A list of the same element and allocator types.

This exchanges the elements between two lists in constant time. Note that the global [std::swap\(\)](#) function is specialized such that `std::swap(l1,l2)` will feed to this function.

Definition at line 1165 of file `stl_list.h`.

Referenced by `std::list<_Tp, _Alloc >::sort()`, and `std::swap()`.

5.534.3.54 `template<typename _Tp , typename _Alloc > void list::unique ()`

Remove consecutive duplicate elements.

For each consecutive set of elements with the same value, remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 266 of file `list.tcc`.

References `std::list<_Tp, _Alloc >::begin()`, and `std::list<_Tp, _Alloc >::end()`.

5.534.3.55 `template<typename _Tp , typename _Alloc > template<typename _BinaryPredicate > void list::unique (_BinaryPredicate __binary_pred)`

Remove consecutive elements satisfying a predicate.

Parameters

BinaryPredicate Binary predicate function or object.

For each consecutive set of elements `[first,last)` that satisfy `predicate(first,i)` where `i` is an iterator in `[first,last)`, remove all but the first one. Remaining elements stay in list order. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 409 of file `list.tcc`.

References `std::list<_Tp, _Alloc >::begin()`, and `std::list<_Tp, _Alloc >::end()`.

5.535 std::locale Class Reference

Container class for localization functionality.

The locale class is first a class wrapper for C library locales. It is also an extensible container for user-defined localization. A locale is a collection of facets that implement various localization features such as money, time, and number printing.

Classes

- class [facet](#)

Localization functionality base class.

The facet class is the base class for a localization feature, such as money, time, and number printing. It provides common support for facets and reference management.

- class [id](#)

Facet ID class.

The ID class provides facets with an index used to identify them. Every facet class must define a public static member [locale::id](#), or be derived from a facet that provides this member, otherwise the facet cannot be used in a locale. The [locale::id](#) ensures that each class type gets a unique identifier.

Public Types

- typedef int [category](#)

5.535.1 Detailed Description

Container class for localization functionality.

The locale class is first a class wrapper for C library locales. It is also an extensible container for user-defined localization. A locale is a collection of facets that implement various localization features such as money, time, and number printing. Constructing C++ locales does not change the C library locale.

This library supports efficient construction and copying of locales through a reference counting implementation of the locale class.

Definition at line 62 of file `locale_classes.h`.

5.535.2 Member Typedef Documentation

5.535.2.1 typedef int std::locale::category

Definition of [locale::category](#).

Definition at line 67 of file locale_classes.h.

5.535.3 Constructor & Destructor Documentation

5.535.3.1 std::locale::locale () throw ()

Default constructor.

Constructs a copy of the global locale. If no locale has been explicitly set, this is the C locale.

Referenced by combine().

5.535.3.2 std::locale::locale (const locale & __other) throw ()

Copy constructor.

Constructs a copy of *other*.

Parameters

other The locale to copy.

5.535.3.3 std::locale::locale (const char * __s) [explicit]

Named locale constructor.

Constructs a copy of the named C library locale.

Parameters

s Name of the locale to construct.

Exceptions

[std::runtime_error](#) if *s* is null or an undefined locale.

5.535.3.4 `std::locale::locale (const locale & __base, const char * __s, category __cat)`

Construct locale with facets from another locale.

Constructs a copy of the locale *base*. The facets specified by *cat* are replaced with those from the locale named by *s*. If *base* is named, this locale instance will also be named.

Parameters

base The locale to copy.

s Name of the locale to use facets from.

cat Set of categories defining the facets to use from *s*.

Exceptions

[*std::runtime_error*](#) if *s* is null or an undefined locale.

5.535.3.5 `std::locale::locale (const locale & __base, const locale & __add, category __cat)`

Construct locale with facets from another locale.

Constructs a copy of the locale *base*. The facets specified by *cat* are replaced with those from the locale *add*. If *base* and *add* are named, this locale instance will also be named.

Parameters

base The locale to copy.

add The locale to use facets from.

cat Set of categories defining the facets to use from *add*.

5.535.3.6 `template<typename _Facet > std::locale::locale (const locale & __other, _Facet * __f)`

Construct locale with another facet.

Constructs a copy of the locale *other*. The facet is added to , replacing an existing facet of type *Facet* if there is one. If *__f* is null, this locale is a copy of *other*.

Parameters

other The locale to copy.

f The facet to add in.

Definition at line 43 of file locale_classes.tcc.

5.535.3.7 std::locale::~~locale () throw ()

Locale destructor.

5.535.4 Member Function Documentation

5.535.4.1 static const locale& std::locale::classic () [static]

Return reference to the C locale.

5.535.4.2 template<typename _Facet > locale std::locale::combine (const locale & __other) const

Construct locale with another facet.

Constructs and returns a new copy of this locale. Adds or replaces an existing facet of type Facet from the locale *other* into the new locale.

Parameters

Facet The facet type to copy from other

other The locale to copy from.

Returns

Newly constructed locale.

Exceptions

[*std::runtime_error*](#) if other has no facet of type Facet.

Definition at line 61 of file locale_classes.tcc.

References locale().

5.535.4.3 static locale std::locale::global (const locale &) [static]

Set global locale.

This function sets the global locale to the argument and returns a copy of the previous global locale. If the argument has a name, it will also call std::setlocale(LC_ALL, loc.name()).

Parameters

locale The new locale to make global.

Returns

Copy of the old global locale.

5.535.4.4 string std::locale::name () const

Return locale name.

Returns

Locale name or "*" if unnamed.

5.535.4.5 bool std::locale::operator!=(const locale & __other) const throw () [inline]

Locale inequality.

Parameters

other The locale to compare against.

Returns

! (*this == other)

Definition at line 234 of file locale_classes.h.

5.535.4.6 template<typename _Char , typename _Traits , typename _Alloc > bool std::locale::operator() (const basic_string< _Char, _Traits, _Alloc > & __s1, const basic_string< _Char, _Traits, _Alloc > & __s2) const

Compare two strings according to collate.

Template operator to compare two strings using the compare function of the collate facet in this locale. One use is to provide the locale to the sort function. For example, a vector *v* of strings could be sorted according to locale *loc* by doing:

```
std::sort(v.begin(), v.end(), loc);
```

Parameters

s1 First string to compare.

s2 Second string to compare.

Returns

True if collate<Char> facet compares *s1* < *s2*, else false.

5.535.4.7 `const locale& std::locale::operator= (const locale & __other) throw ()`

Assignment operator.

Set this locale to be a copy of *other*.

Parameters

other The locale to copy.

Returns

A reference to this locale.

5.535.4.8 `bool std::locale::operator== (const locale & __other) const throw ()`

Locale equality.

Parameters

other The locale to compare against.

Returns

True if *other* and this refer to the same locale instance, are copies, or have the same name. False otherwise.

5.535.5 Friends And Related Function Documentation

5.535.5.1 `template<typename _Facet > bool has_facet (const locale &)
throw () [friend]`

Test for the presence of a facet.

`has_facet` tests the locale argument for the presence of the facet type provided as the template parameter. Facets derived from the facet parameter will also return true.

Parameters

Facet The facet type to test the presence of.

locale The locale to test.

Returns

true if locale contains a facet of type Facet, else false.

5.535.5.2 template<typename _Facet > const _Facet& use_facet (const locale &) [friend]

Return a facet.

use_facet looks for and returns a reference to a facet of type Facet where Facet is the template parameter. If has_facet(locale) is true, there is a suitable facet to return. It throws [std::bad_cast](#) if the locale doesn't contain a facet of type Facet.

Parameters

Facet The facet type to access.

locale The locale to use.

Returns

Reference to facet of type Facet.

Exceptions

[std::bad_cast](#) if locale doesn't contain a facet of type Facet.

5.535.6 Member Data Documentation**5.535.6.1 const category std::locale::all [static]**

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match _S_facet_categories definition in locale.cc

Definition at line 105 of file locale_classes.h.

5.535.6.2 const category std::locale::collate [static]

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

Definition at line 101 of file `locale_classes.h`.

5.535.6.3 const category std::locale::ctype [static]

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

Definition at line 99 of file `locale_classes.h`.

5.535.6.4 const category std::locale::messages [static]

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

Definition at line 104 of file `locale_classes.h`.

5.535.6.5 const category std::locale::monetary [static]

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

Definition at line 103 of file `locale_classes.h`.

5.535.6.6 const category std::locale::none [static]

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

Definition at line 98 of file `locale_classes.h`.

5.535.6.7 `const category std::locale::numeric` `[static]`

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

Definition at line 100 of file `locale_classes.h`.

5.535.6.8 `const category std::locale::time` `[static]`

Category values.

The standard category values are none, ctype, numeric, collate, time, monetary, and messages. They form a bitmask that supports union and intersection. The category all is the union of these values.

NB: Order must match `_S_facet_categories` definition in `locale.cc`

Definition at line 102 of file `locale_classes.h`.

5.536 `std::locale::facet` Class Reference

Localization functionality base class.

The facet class is the base class for a localization feature, such as money, time, and number printing. It provides common support for facets and reference management.

Inheritance diagram for std::locale::facet:

Protected Member Functions

- `facet` (size_t __refs=0) throw ()
- virtual `~facet` ()

Static Protected Member Functions

- static `__c_locale _S_clone_c_locale (__c_locale &__cloc) throw ()`
- static void `_S_create_c_locale (__c_locale &__cloc, const char *__s, __c_locale __old=0)`
- static void `_S_destroy_c_locale (__c_locale &__cloc)`
- static `__c_locale _S_get_c_locale ()`
- static `_GLIBCXX_CONST const char * _S_get_c_name () throw ()`
- static `__c_locale _S_lc_ctype_c_locale (__c_locale __cloc, const char *__s)`

Friends

- class `locale`
- class `locale::_Impl`

5.536.1 Detailed Description

Localization functionality base class.

The facet class is the base class for a localization feature, such as money, time, and number printing. It provides common support for facets and reference management. Facets may not be copied or assigned.

Definition at line 337 of file `locale_classes.h`.

5.536.2 Constructor & Destructor Documentation

5.536.2.1 `std::locale::facet::facet (size_t __refs = 0) throw () [inline, explicit, protected]`

Facet constructor.

This is the constructor provided by the standard. If `refs` is 0, the facet is destroyed when the last referencing locale is destroyed. Otherwise the facet will never be destroyed.

Parameters

refs The initial value for reference count.

Definition at line 369 of file `locale_classes.h`.

5.536.2.2 `virtual std::locale::facet::~~facet () [protected, virtual]`

Facet destructor.

The documentation for this class was generated from the following file:

- [locale_classes.h](#)

5.537 std::locale::id Class Reference

Facet ID class.

The ID class provides facets with an index used to identify them. Every facet class must define a public static member `locale::id`, or be derived from a facet that provides this member, otherwise the facet cannot be used in a locale. The `locale::id` ensures that each class type gets a unique identifier.

Public Member Functions

- [id](#) ()
- `size_t _M_id () const throw ()`

Friends

- `template<typename _Facet >`
`bool has_facet (const locale &) throw ()`
- `class locale`
- `class locale::_Impl`
- `template<typename _Facet >`
`const _Facet & use_facet (const locale &)`

5.537.1 Detailed Description

Facet ID class.

The ID class provides facets with an index used to identify them. Every facet class must define a public static member [locale::id](#), or be derived from a facet that provides this member, otherwise the facet cannot be used in a locale. The [locale::id](#) ensures that each class type gets a unique identifier.

Definition at line 435 of file locale_classes.h.

5.537.2 Constructor & Destructor Documentation

5.537.2.1 `std::locale::id::id () [inline]`

Constructor.

Definition at line 466 of file locale_classes.h.

5.537.3 Friends And Related Function Documentation

5.537.3.1 `template<typename _Facet > bool has_facet (const locale &) throw () [friend]`

Test for the presence of a facet.

`has_facet` tests the locale argument for the presence of the facet type provided as the template parameter. Facets derived from the facet parameter will also return true.

Parameters

Facet The facet type to test the presence of.

locale The locale to test.

Returns

true if locale contains a facet of type Facet, else false.

5.537.3.2 `template<typename _Facet > const _Facet& use_facet (const locale &) [friend]`

Return a facet.

use_facet looks for and returns a reference to a facet of type Facet where Facet is the template parameter. If has_facet(locale) is true, there is a suitable facet to return. It throws [std::bad_cast](#) if the locale doesn't contain a facet of type Facet.

Parameters

Facet The facet type to access.

locale The locale to use.

Returns

Reference to facet of type Facet.

Exceptions

[std::bad_cast](#) if locale doesn't contain a facet of type Facet.

The documentation for this class was generated from the following file:

5.539 std::logic_error Class Reference

One of two subclasses of exception.

Inheritance diagram for std::logic_error:

Public Member Functions

- [logic_error](#) (const [string](#) &__arg)
- virtual const char * [what](#) () const throw ()

5.539.1 Detailed Description

One of two subclasses of exception. Logic errors represent problems in the internal logic of a program; in theory, these are preventable, and even detectable before the program runs (e.g., violations of class invariants).

Definition at line 53 of file `stdexcept`.

5.539.2 Constructor & Destructor Documentation

5.539.2.1 `std::logic_error::logic_error (const string & __arg) [explicit]`

Takes a character string describing the error.

5.539.3 Member Function Documentation

5.539.3.1 `virtual const char* std::logic_error::what () const throw () [virtual]`

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

Reimplemented in [std::future_error](#).

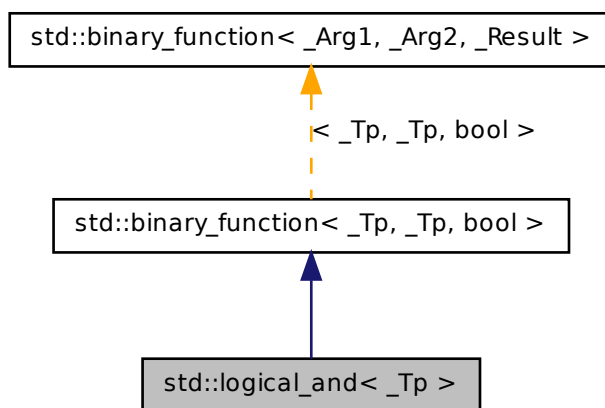

The documentation for this class was generated from the following file:

- [stdexcept](#)

5.543.1 Detailed Description

template<typename _RealType = double> class std::lognormal_distribution< _RealType >

A [lognormal_distribution](#) random number distribution. The formula for the normal probability mass function is

$$p(x|m, s) = \frac{1}{sx\sqrt{2\pi}} \exp - \frac{(\ln x - m)^2}{2s^2}$$

Definition at line 2177 of file random.h.

5.543.2 Member Typedef Documentation

5.543.2.1 `template<typename _RealType = double> typedef _RealType
std::lognormal_distribution< _RealType >::result_type`

The type of the range of the distribution.

Definition at line 2184 of file random.h.

5.543.3 Member Function Documentation

5.543.3.1 `template<typename _RealType = double> result_type
std::lognormal_distribution< _RealType >::max () const
[inline]`

Returns the least upper bound value of the distribution.

Definition at line 2268 of file random.h.

5.543.3.2 `template<typename _RealType = double> result_type
std::lognormal_distribution< _RealType >::min () const
[inline]`

Returns the greatest lower bound value of the distribution.

Definition at line 2261 of file random.h.

5.543.3.3 `template<typename _RealType = double> template<typename
_UniformRandomNumberGenerator > result_type
std::lognormal_distribution< _RealType >::operator() (
_UniformRandomNumberGenerator & __urng) [inline]`

Generating functions.

Definition at line 2276 of file random.h.

References `std::lognormal_distribution< _RealType >::operator()()`, and
`std::lognormal_distribution< _RealType >::param()`.

Referenced by `std::lognormal_distribution< _RealType >::operator()()`.

5.543.3.4 `template<typename _RealType = double> void
std::lognormal_distribution< _RealType >::param (const
param_type & __param) [inline]`

Sets the parameter set of the distribution.

5.543 std::lognormal_distribution< _RealType > Class Template Reference 2653

Parameters

`__param` The new parameter set of the distribution.

Definition at line 2254 of file random.h.

```
5.543.3.5 template<typename _RealType = double> param_type  
std::lognormal_distribution< _RealType >::param ( ) const  
[inline]
```

Returns the parameter set of the distribution.

Definition at line 2246 of file random.h.

Referenced by std::lognormal_distribution< _RealType >::operator()().

```
5.543.3.6 template<typename _RealType = double> void  
std::lognormal_distribution< _RealType >::reset ( ) [inline]
```

Resets the distribution state.

Definition at line 2228 of file random.h.

References std::normal_distribution< _RealType >::reset().

5.543.4 Friends And Related Function Documentation

```
5.543.4.1 template<typename _RealType = double> template<typename  
_RealType1 , typename _CharT , typename _Traits >  
std::basic_ostream<_CharT, _Traits>& operator<<  
( std::basic_ostream< _CharT, _Traits > & , const  
std::lognormal_distribution< _RealType1 > & ) [friend]
```

Inserts a lognormal_distribution random number distribution `__x` into the output stream `__os`.

Parameters

`__os` An output stream.

`__x` A lognormal_distribution random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

5.543.4.2 `template<typename _RealType = double> template<typename
_RealType1 > bool operator==(const std::lognormal_distribution<
_RealType1 > & __d1, const std::lognormal_distribution<
_RealType1 > & __d2) [friend]`

Return true if two lognormal distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 2292 of file random.h.

5.543.4.3 `template<typename _RealType = double> template<typename
_RealType1 , typename _CharT , typename _Traits >
std::basic_istream<_CharT, _Traits>& operator>>
(std::basic_istream< _CharT, _Traits > & ,
std::lognormal_distribution< _RealType1 > &) [friend]`

Extracts a lognormal_distribution random number distribution __x from the input stream __is.

Parameters

__is An input stream.

__x A lognormal_distribution random number generator engine.

Returns

The input stream with __x extracted or in an error state.

5.547.1 Detailed Description

`template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp> >> class std::map< _Key, _Tp, _Compare, _Alloc >`

A standard container made up of (key,value) pairs, which can be retrieved based on a key, in logarithmic time. Meets the requirements of a [container](#), a [reversible container](#), and an [associative container](#) (using unique keys). For a `map<Key, T>` the `key_type` is `Key`, the `mapped_type` is `T`, and the `value_type` is `std::pair<const Key, T>`.

Maps support bidirectional iterators.

The private tree data is declared exactly the same way for `map` and `multimap`; the distinction is made entirely in how the tree functions are called (`*_unique` versus `*_equal`, same as the standard).

Definition at line 86 of file `stl_map.h`.

5.547.2 Constructor & Destructor Documentation

5.547.2.1 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::map< _Key, _Tp, _Compare, _Alloc >::map () [inline]`

Default constructor creates no elements.

Definition at line 150 of file stl_map.h.

5.547.2.2 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::map< _Key, _Tp, _Compare, _Alloc >::map (const _Compare & __comp, const allocator_type & __a = allocator_type()) [inline, explicit]`

Creates a map with no elements.

Parameters

comp A comparison object.

a An allocator object.

Definition at line 159 of file stl_map.h.

5.547.2.3 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::map< _Key, _Tp, _Compare, _Alloc >::map (const map< _Key, _Tp, _Compare, _Alloc > & __x) [inline]`

Map copy constructor.

Parameters

x A map of identical element and allocator types.

The newly-created map uses a copy of the allocation object used by *x*.

Definition at line 170 of file stl_map.h.

5.547.2.4 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::map<_Key, _Tp, _Compare, _Alloc>::map (map<_Key, _Tp, _Compare, _Alloc> && __x) [inline]`

Map move constructor.

Parameters

x A map of identical element and allocator types.

The newly-created map contains the exact contents of *x*. The contents of *x* are a valid, but unspecified map.

Definition at line 181 of file `stl_map.h`.

5.547.2.5 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::map<_Key, _Tp, _Compare, _Alloc>::map (initializer_list<value_type> & __l, const _Compare & __c = _Compare(), const allocator_type & __a = allocator_type()) [inline]`

Builds a map from an [initializer_list](#).

Parameters

l An [initializer_list](#).

comp A comparison object.

a An allocator object.

Create a map consisting of copies of the elements in the [initializer_list](#) *l*. This is linear in *N* if the range is already sorted, and *NlogN* otherwise (where *N* is *l.size()*).

Definition at line 195 of file `stl_map.h`.

5.547.2.6 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> template<typename _InputIterator> std::map<_Key, _Tp, _Compare, _Alloc>::map (_InputIterator __first, _InputIterator __last) [inline]`

Builds a map from a range.

Parameters

first An input iterator.

5.547 std::map< _Key, _Tp, _Compare, _Alloc > Class Template Reference 2661

last An input iterator.

Create a map consisting of copies of the elements from [first,last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(first,last)).

Definition at line 212 of file stl_map.h.

```
5.547.2.7 template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp>>> template<typename _InputIterator > std::map<
_Key, _Tp, _Compare, _Alloc >::map ( _InputIterator __first,
_InputIterator __last, const _Compare & __comp, const
allocator_type & __a = allocator_type() ) [inline]
```

Builds a map from a range.

Parameters

first An input iterator.

last An input iterator.

comp A comparison functor.

a An allocator object.

Create a map consisting of copies of the elements from [first,last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(first,last)).

Definition at line 228 of file stl_map.h.

5.547.3 Member Function Documentation

```
5.547.3.1 template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp>>> mapped_type& std::map< _Key, _Tp, _Compare,
_Alloc >::at ( const key_type & __k ) [inline]
```

Access to map data.

Parameters

k The key for which data should be retrieved.

Returns

A reference to the data whose key is equivalent to *k*, if such a data is present in the map.

Exceptions

std::out_of_range If no such data is present.

Definition at line 465 of file stl_map.h.

References `std::end()`.

5.547.3.2 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp>>> iterator std::map<_Key, _Tp, _Compare, _Alloc
>::begin () [inline]`

Returns a read/write iterator that points to the first pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 307 of file stl_map.h.

5.547.3.3 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp>>> const_iterator std::map<_Key, _Tp, _Compare,
_Alloc>::begin () const [inline]`

Returns a read-only (constant) iterator that points to the first pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 316 of file stl_map.h.

5.547.3.4 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp>>> const_iterator std::map<_Key, _Tp, _Compare,
_Alloc>::cbegin () const [inline]`

Returns a read-only (constant) iterator that points to the first pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 380 of file stl_map.h.

5.547.3.5 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp>>> const_iterator std::map<_Key, _Tp, _Compare,
_Alloc>::cend () const [inline]`

Returns a read-only (constant) iterator that points one past the last pair in the map. Iteration is done in ascending order according to the keys.

5.547 std::map< _Key, _Tp, _Compare, _Alloc > Class Template Reference 2663

Definition at line 389 of file stl_map.h.

5.547.3.6 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp> >> void std::map< _Key, _Tp, _Compare, _Alloc
>::clear () [inline]`

Erases all elements in a map. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 663 of file stl_map.h.

5.547.3.7 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp> >> size_type std::map< _Key, _Tp, _Compare, _Alloc
>::count (const key_type & __x) const [inline]`

Finds the number of elements with given key.

Parameters

x Key of (key, value) pairs to be located.

Returns

Number of elements with specified key.

This function only makes sense for multimaps; for map the result will either be 0 (not present) or 1 (present).

Definition at line 723 of file stl_map.h.

5.547.3.8 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp> >> const_reverse_iterator std::map< _Key, _Tp,
_Compare, _Alloc >::rbegin () const [inline]`

Returns a read-only (constant) reverse iterator that points to the last pair in the map. Iteration is done in descending order according to the keys.

Definition at line 398 of file stl_map.h.

5.547.3.9 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp>>> const_reverse_iterator std::map< _Key, _Tp,
_Compare, _Alloc >::crend () const [inline]`

Returns a read-only (constant) reverse iterator that points to one before the first pair in the map. Iteration is done in descending order according to the keys.

Definition at line 407 of file `stl_map.h`.

5.547.3.10 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp>>> bool std::map< _Key, _Tp, _Compare, _Alloc
>::empty () const [inline]`

Returns true if the map is empty. (Thus `begin()` would equal `end()`.)

Definition at line 416 of file `stl_map.h`.

5.547.3.11 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp>>> const_iterator std::map< _Key, _Tp, _Compare,
_Alloc >::end () const [inline]`

Returns a read-only (constant) iterator that points one past the last pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 334 of file `stl_map.h`.

5.547.3.12 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp>>> iterator std::map< _Key, _Tp, _Compare, _Alloc
>::end () [inline]`

Returns a read/write iterator that points one past the last pair in the map. Iteration is done in ascending order according to the keys.

Definition at line 325 of file `stl_map.h`.

5.547 std::map< _Key, _Tp, _Compare, _Alloc > Class Template Reference 2665

5.547.3.13 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp> >> std::pair<iterator, iterator> std::map< _Key,
_Tp, _Compare, _Alloc >::equal_range (const key_type & __x)
[inline]`

Finds a subsequence matching given key.

Parameters

x Key of (key, value) pairs to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),  
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multimaps.

Definition at line 792 of file stl_map.h.

5.547.3.14 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp> >> std::pair<const_iterator, const_iterator>
std::map< _Key, _Tp, _Compare, _Alloc >::equal_range (const
key_type & __x) const [inline]`

Finds a subsequence matching given key.

Parameters

x Key of (key, value) pairs to be located.

Returns

Pair of read-only (constant) iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),  
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multimaps.

Definition at line 811 of file `stl_map.h`.

```
5.547.3.15  template<typename _Key, typename _Tp, typename _Compare =
              std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
              _Key, _Tp>>> iterator std::map<_Key, _Tp, _Compare, _Alloc
              >::erase ( iterator __position ) [inline]
```

Erases an element from a map.

Parameters

position An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 573 of file `stl_map.h`.

```
5.547.3.16  template<typename _Key, typename _Tp, typename _Compare =
              std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
              _Key, _Tp>>> size_type std::map<_Key, _Tp, _Compare, _Alloc
              >::erase ( const key_type & __x ) [inline]
```

Erases elements according to the provided key.

Parameters

x Key of element to be erased.

Returns

The number of elements erased.

This function erases all the elements located by the given key from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 603 of file `stl_map.h`.

5.547 std::map< _Key, _Tp, _Compare, _Alloc > Class Template Reference 2667

5.547.3.17 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp>>> iterator std::map< _Key, _Tp, _Compare, _Alloc
>::erase (iterator __first, iterator __last) [inline]`

Erases a [first,last) range of elements from a map.

Parameters

first Iterator pointing to the start of the range to be erased.

last Iterator pointing to the end of the range to be erased.

Returns

The iterator *last*.

This function erases a sequence of elements from a map. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 622 of file stl_map.h.

5.547.3.18 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp>>> const_iterator std::map< _Key, _Tp, _Compare,
_Alloc >::find (const key_type & __x) const [inline]`

Tries to locate an element in a map.

Parameters

x Key of (key, value) pair to be located.

Returns

Read-only (constant) iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns a constant iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 711 of file stl_map.h.

5.547.3.19 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> iterator std::map<_Key, _Tp, _Compare, _Alloc>::find (const key_type & __x) [inline]`

Tries to locate an element in a map.

Parameters

x Key of (key, value) pair to be located.

Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 696 of file `stl_map.h`.

5.547.3.20 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> allocator_type std::map<_Key, _Tp, _Compare, _Alloc>::get_allocator () const [inline]`

Get a copy of the memory allocation object.

Definition at line 297 of file `stl_map.h`.

5.547.3.21 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::pair<iterator, bool> std::map<_Key, _Tp, _Compare, _Alloc>::insert (const value_type & __x) [inline]`

Attempts to insert a `std::pair` into the map.

Parameters

x Pair to be inserted (see `std::make_pair` for easy creation of pairs).

Returns

A pair, of which the first element is an iterator that points to the possibly inserted pair, and the second is a bool that is true if the pair was actually inserted.

5.547 std::map< _Key, _Tp, _Compare, _Alloc > Class Template Reference 2669

This function attempts to insert a (key, value) pair into the map. A map relies on unique keys and thus a pair is only inserted if its first element (the key) is not already present in the map.

Insertion requires logarithmic time.

Definition at line 500 of file stl_map.h.

```
5.547.3.22 template<typename _Key, typename _Tp, typename _Compare =  
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const  
_Key, _Tp> >> void std::map< _Key, _Tp, _Compare, _Alloc  
>::insert ( std::initializer_list< value_type > __list ) [inline]
```

Attempts to insert a list of std::pairs into the map.

Parameters

list A std::initializer_list<value_type> of pairs to be inserted.

Complexity similar to that of the range constructor.

Definition at line 512 of file stl_map.h.

References std::map< _Key, _Tp, _Compare, _Alloc >::insert().

Referenced by std::map< _Key, _Tp, _Compare, _Alloc >::insert().

```
5.547.3.23 template<typename _Key, typename _Tp, typename _Compare =  
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const  
_Key, _Tp> >> iterator std::map< _Key, _Tp, _Compare, _Alloc  
>::insert ( iterator __position, const value_type & __x )  
[inline]
```

Attempts to insert a [std::pair](#) into the map.

Parameters

position An iterator that serves as a hint as to where the pair should be inserted.

x Pair to be inserted (see [std::make_pair](#) for easy creation of pairs).

Returns

An iterator that points to the element with key of *x* (may or may not be the pair passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument [insert\(\)](#) does. Note that the first parameter

is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html> for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 540 of file `stl_map.h`.

```
5.547.3.24  template<typename _Key, typename _Tp, typename _Compare =
              std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
              _Key, _Tp>>> template<typename _InputIterator > void
              std::map<_Key, _Tp, _Compare, _Alloc >::insert ( _InputIterator
              __first, _InputIterator __last ) [inline]
```

Template function that attempts to insert a range of elements.

Parameters

first Iterator pointing to the start of the range to be inserted.

last Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 553 of file `stl_map.h`.

```
5.547.3.25  template<typename _Key, typename _Tp, typename _Compare =
              std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
              _Key, _Tp>>> key_compare std::map<_Key, _Tp, _Compare,
              _Alloc >::key_comp ( ) const [inline]
```

Returns the key comparison object out of which the map was constructed.

Definition at line 672 of file `stl_map.h`.

```
5.547.3.26  template<typename _Key, typename _Tp, typename _Compare =
              std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
              _Key, _Tp>>> iterator std::map<_Key, _Tp, _Compare, _Alloc
              >::lower_bound ( const key_type & __x ) [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

x Key of (key, value) pair to be located.

5.547 std::map< _Key, _Tp, _Compare, _Alloc > Class Template Reference 2671

Returns

Iterator pointing to first element equal to or greater than key, or `end()`.

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or `end()` if no such element exists.

Definition at line 738 of file `stl_map.h`.

```
5.547.3.27  template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp> >> const_iterator std::map< _Key, _Tp, _Compare,
_Alloc >::lower_bound ( const key_type & __x ) const  [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

x Key of (key, value) pair to be located.

Returns

Read-only (constant) iterator pointing to first element equal to or greater than key, or `end()`.

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or `end()` if no such element exists.

Definition at line 753 of file `stl_map.h`.

```
5.547.3.28  template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp> >> size_type std::map< _Key, _Tp, _Compare, _Alloc
>::max_size ( ) const  [inline]
```

Returns the maximum size of the map.

Definition at line 426 of file `stl_map.h`.

```
5.547.3.29  template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp> >> map& std::map< _Key, _Tp, _Compare, _Alloc
>::operator= ( map< _Key, _Tp, _Compare, _Alloc > && __x )
[inline]
```

Map move assignment operator.

Parameters

x A map of identical element and allocator types.

The contents of *x* are moved into this map (without copying). *x* is a valid, but unspecified map.

Definition at line 266 of file `stl_map.h`.

```
5.547.3.30  template<typename _Key, typename _Tp, typename _Compare =
              std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
              _Key, _Tp>>> map& std::map<_Key, _Tp, _Compare, _Alloc
              >::operator= ( const map<_Key, _Tp, _Compare, _Alloc> & __x
              ) [inline]
```

Map assignment operator.

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Parameters

x A map of identical element and allocator types.

All the elements of *x* are copied, but unlike the copy constructor, the allocator object is not copied.

Definition at line 251 of file `stl_map.h`.

```
5.547.3.31  template<typename _Key, typename _Tp, typename _Compare =
              std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
              _Key, _Tp>>> map& std::map<_Key, _Tp, _Compare, _Alloc
              >::operator= ( initializer_list<value_type> & __l ) [inline]
```

Map list assignment operator.

Parameters

l An [initializer_list](#).

This function fills a map with copies of the elements in the initializer list *l*.

Note that the assignment completely changes the map and that the resulting map's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 287 of file `stl_map.h`.

5.547 std::map< _Key, _Tp, _Compare, _Alloc > Class Template Reference 2673

5.547.3.32 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp> >> mapped_type& std::map< _Key, _Tp, _Compare,
_Alloc >::operator[] (const key_type & __k) [inline]`

Subscript ([]) access to map data.

Parameters

k The key for which data should be retrieved.

Returns

A reference to the data of the (key,data) pair.

Allows for easy lookup with the subscript ([]) operator. Returns data associated with the key specified in subscript. If the key does not exist, a pair with that key is created using default values, which is then returned.

Lookup requires logarithmic time.

Definition at line 443 of file stl_map.h.

References std::end().

5.547.3.33 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp> >> reverse_iterator std::map< _Key, _Tp, _Compare,
_Alloc >::rbegin () [inline]`

Returns a read/write reverse iterator that points to the last pair in the map. Iteration is done in descending order according to the keys.

Definition at line 343 of file stl_map.h.

5.547.3.34 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp> >> const_reverse_iterator std::map< _Key, _Tp,
_Compare, _Alloc >::rbegin () const [inline]`

Returns a read-only (constant) reverse iterator that points to the last pair in the map. Iteration is done in descending order according to the keys.

Definition at line 352 of file stl_map.h.

5.547.3.35 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_reverse_iterator std::map<_Key, _Tp, _Compare, _Alloc>::rend () const [inline]`

Returns a read-only (constant) reverse iterator that points to one before the first pair in the map. Iteration is done in descending order according to the keys.

Definition at line 370 of file `stl_map.h`.

5.547.3.36 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> reverse_iterator std::map<_Key, _Tp, _Compare, _Alloc>::rend () [inline]`

Returns a read/write reverse iterator that points to one before the first pair in the map. Iteration is done in descending order according to the keys.

Definition at line 361 of file `stl_map.h`.

5.547.3.37 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> size_type std::map<_Key, _Tp, _Compare, _Alloc>::size () const [inline]`

Returns the size of the map.

Definition at line 421 of file `stl_map.h`.

5.547.3.38 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> void std::map<_Key, _Tp, _Compare, _Alloc>::swap (map<_Key, _Tp, _Compare, _Alloc> & __x) [inline]`

Swaps data with another map.

Parameters

x A map of the same element and allocator types.

This exchanges the elements between two maps in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(m1,m2)` will feed to this function.

5.547 std::map< _Key, _Tp, _Compare, _Alloc > Class Template Reference 2675

Definition at line 653 of file stl_map.h.

Referenced by std::swap().

```
5.547.3.39  template<typename _Key, typename _Tp, typename _Compare =  
             std::less<_Key>, typename _Alloc = std::allocator<std::pair<const  
             _Key, _Tp>>> const_iterator std::map< _Key, _Tp, _Compare,  
             _Alloc >::upper_bound ( const key_type & __x ) const  
             [inline]
```

Finds the end of a subsequence matching given key.

Parameters

x Key of (key, value) pair to be located.

Returns

Read-only (constant) iterator pointing to first iterator greater than key, or [end\(\)](#).

Definition at line 773 of file stl_map.h.

```
5.547.3.40  template<typename _Key, typename _Tp, typename _Compare =  
             std::less<_Key>, typename _Alloc = std::allocator<std::pair<const  
             _Key, _Tp>>> iterator std::map< _Key, _Tp, _Compare, _Alloc  
             >::upper_bound ( const key_type & __x ) [inline]
```

Finds the end of a subsequence matching given key.

Parameters

x Key of (key, value) pair to be located.

Returns

Iterator pointing to the first element greater than key, or [end\(\)](#).

Definition at line 763 of file stl_map.h.

```
5.547.3.41  template<typename _Key, typename _Tp, typename _Compare =  
             std::less<_Key>, typename _Alloc = std::allocator<std::pair<const  
             _Key, _Tp>>> value_compare std::map< _Key, _Tp, _Compare,  
             _Alloc >::value_comp ( ) const [inline]
```

Returns a value comparison object, built from the key comparison object out of which the map was constructed.

Definition at line 680 of file `stl_map.h`.

5.548.1 Detailed Description

`template<class _Tp> class std::mask_array< _Tp >`

Reference to selected subset of an array. A `mask_array` is a reference to the actual elements of an array specified by a bitmask in the form of an array of bool. The way to get a `mask_array` is to call `operator[]`(`valarray`<bool>) on a `valarray`. The returned `mask_array` then permits carrying operations out on the referenced subset of elements in the original `valarray`.

For example, if a `mask_array` is obtained using the array (false, true, false, true) as an argument, the mask array has two elements referring to `array[1]` and `array[3]` in the underlying array.

Parameters

Tp Element type.

Definition at line 61 of file `mask_array.h`.

5.548.2 Member Function Documentation

5.548.2.1 `template<class _Tp> void std::mask_array< _Tp >::operator%= (const valarray< _Tp > &) const`

Modulo slice elements by corresponding elements of v.

5.548.2.2 `template<class _Tp> void std::mask_array< _Tp >::operator&= (const valarray< _Tp > &) const`

Logical and slice elements with corresponding elements of *v*.

5.548.2.3 `template<class _Tp> void std::mask_array< _Tp >::operator*= (const valarray< _Tp > &) const`

Multiply slice elements by corresponding elements of *v*.

5.548.2.4 `template<class _Tp> void std::mask_array< _Tp >::operator+= (const valarray< _Tp > &) const`

Add corresponding elements of *v* to slice elements.

5.548.2.5 `template<class _Tp> void std::mask_array< _Tp >::operator-= (const valarray< _Tp > &) const`

Subtract corresponding elements of *v* from slice elements.

5.548.2.6 `template<class _Tp> void std::mask_array< _Tp >::operator/= (const valarray< _Tp > &) const`

Divide slice elements by corresponding elements of *v*.

5.548.2.7 `template<class _Tp> void std::mask_array< _Tp >::operator<<= (const valarray< _Tp > &) const`

Left shift slice elements by corresponding elements of *v*.

5.548.2.8 `template<class _Tp> void std::mask_array< _Tp >::operator>>= (const valarray< _Tp > &) const`

Right shift slice elements by corresponding elements of *v*.

5.548.2.9 `template<class _Tp> void std::mask_array< _Tp >::operator^= (const valarray< _Tp > &) const`

Logical xor slice elements with corresponding elements of *v*.

5.549 std::match_results< _Bi_iter, _Allocator > Class Template Reference 2679

5.548.2.10 `template<class _Tp> void std::mask_array< _Tp >::operator|= (const valarray< _Tp > &) const`

Logical or slice elements with corresponding elements of v.

The documentation for this class was generated from the following file:

- [mask_array.h](#)

- `allocator_type get_allocator` () `const`

10.6 Swap

- void `swap` (`match_results` &__that)

5.549.1 Detailed Description

```
template<typename _Bi_iter, typename _Allocator = allocator<sub_match<_Bi_iter>>>> class std::match_results< _Bi_iter, _Allocator >
```

The results of a match or search operation. A collection of character sequences representing the result of a regular expression match. Storage for the collection is allocated and freed as necessary by the member functions of class template `match_results`.

This class satisfies the Sequence requirements, with the exception that only the operations defined for a const-qualified Sequence are supported.

The `sub_match` object stored at index 0 represents sub-expression 0, i.e. the whole match. In this case the `sub_match` member `matched` is always true. The `sub_match` object stored at index `n` denotes what matched the marked sub-expression `n` within the matched expression. If the sub-expression `n` participated in a regular expression match then the `sub_match` member `matched` evaluates to true, and members `first` and `second` denote the range of characters [`first`, `second`) which formed that match. Otherwise `matched` is false, and members `first` and `second` point to the end of the sequence that was searched.

Definition at line 1446 of file `regex.h`.

5.549.2 Constructor & Destructor Documentation

```
5.549.2.1 template<typename _Bi_iter, typename _Allocator =
allocator<sub_match<_Bi_iter>>>> std::match_results<
_Bi_iter, _Allocator >::match_results ( const _Allocator & __a =
_Allocator() ) [inline, explicit]
```

Constructs a default `match_results` container.

Postcondition

`size()` returns 0 and `str()` returns an empty string.

Definition at line 1495 of file `regex.h`.

Referenced by `std::match_results< _FwdIterT, _Alloc >::operator=()`.

5.549.2.2 `template<typename _Bi_iter, typename _Allocator =
allocator<sub_match<_Bi_iter>>> std::match_results<_Bi_iter,
_Allocator>::match_results (const match_results<_Bi_iter,
_Allocator> & __rhs) [inline]`

Copy constructs a match_results.

Definition at line 1502 of file regex.h.

5.549.2.3 `template<typename _Bi_iter, typename _Allocator =
allocator<sub_match<_Bi_iter>>> std::match_results<_Bi_iter,
_Allocator>::~~match_results () [inline]`

Destroys a match_results object.

Definition at line 1519 of file regex.h.

5.549.3 Member Function Documentation

5.549.3.1 `template<typename _Bi_iter, typename _Allocator =
allocator<sub_match<_Bi_iter>>> const_iterator
std::match_results<_Bi_iter, _Allocator>::begin () const
[inline]`

Gets an iterator to the start of the sub_match collection.

Reimplemented from [std::vector< std::sub_match<_Bi_iter>, _Allocator >](#).

Definition at line 1658 of file regex.h.

5.549.3.2 `template<typename _Bi_iter, typename _Allocator =
allocator<sub_match<_Bi_iter>>> const_iterator
std::match_results<_Bi_iter, _Allocator>::cbegin () const
[inline]`

Gets an iterator to the start of the sub_match collection.

Reimplemented from [std::vector< std::sub_match<_Bi_iter>, _Allocator >](#).

Definition at line 1665 of file regex.h.

5.549 std::match_results< _Bi_iter, _Allocator > Class Template Reference 2685

5.549.3.3 `template<typename _Bi_iter, typename _Allocator =
allocator<sub_match<_Bi_iter> >> const_iterator
std::match_results< _Bi_iter, _Allocator >::cend () const
[inline]`

Gets an iterator to one-past-the-end of the collection.

Reimplemented from [std::vector< std::sub_match< _Bi_iter >, _Allocator >](#).

Definition at line 1683 of file regex.h.

5.549.3.4 `template<typename _Bi_iter, typename _Allocator =
allocator<sub_match<_Bi_iter> >> bool std::match_results<
_Bi_iter, _Allocator >::empty () const [inline]`

Indicates if the match_results contains no results.

Return values

true The match_results object is empty.

false The match_results object is not empty.

Reimplemented from [std::vector< std::sub_match< _Bi_iter >, _Allocator >](#).

Definition at line 1555 of file regex.h.

Referenced by `std::match_results< _FwdIterT, _Alloc >::cend()`, `std::match_results< _FwdIterT, _Alloc >::end()`, `std::match_results< _FwdIterT, _Alloc >::prefix()`, and `std::match_results< _FwdIterT, _Alloc >::suffix()`.

5.549.3.5 `template<typename _Bi_iter, typename _Allocator =
allocator<sub_match<_Bi_iter> >> const_iterator
std::match_results< _Bi_iter, _Allocator >::end () const
[inline]`

Gets an iterator to one-past-the-end of the collection.

Reimplemented from [std::vector< std::sub_match< _Bi_iter >, _Allocator >](#).

Definition at line 1672 of file regex.h.

```

5.549.3.6 template<typename _Bi_iter, typename _Allocator
= allocator<sub_match<_Bi_iter> >> string_type
std::match_results< _Bi_iter, _Allocator >::format ( const
string_type & __fmt, regex_constants::match_flag_type __flags =
regex_constants::format_default ) const

```

Todo

Implement this function.

```

5.549.3.7 template<typename _Bi_iter, typename _Allocator =
allocator<sub_match<_Bi_iter> >> template<typename
_Out_iter > _Out_iter std::match_results< _Bi_iter,
_Alocator >::format ( _Out_iter __out, const string_type
& __fmt, regex_constants::match_flag_type __flags =
regex_constants::format_default ) const [inline]

```

Todo

Implement this function.

Definition at line 1707 of file regex.h.

```

5.549.3.8 template<typename _Bi_iter, typename _Allocator =
allocator<sub_match<_Bi_iter> >> allocator_type
std::match_results< _Bi_iter, _Allocator >::get_allocator ( ) const
[inline]

```

Gets a copy of the allocator.

Reimplemented from [std::_Vector_base< std::sub_match< _Bi_iter >, _Allocator >](#).

Definition at line 1731 of file regex.h.

```

5.549.3.9 template<typename _Bi_iter, typename _Allocator =
allocator<sub_match<_Bi_iter> >> difference_type
std::match_results< _Bi_iter, _Allocator >::length ( size_type __sub
= 0 ) const [inline]

```

Gets the length of the indicated submatch.

Parameters

sub indicates the submatch.

5.549 std::match_results< _Bi_iter, _Allocator > Class Template Reference 2687

This function returns the length of the indicated submatch, or the length of the entire match if `sub` is zero (the default).

Definition at line 1573 of file `regex.h`.

```
5.549.3.10  template<typename _Bi_iter, typename _Allocator =  
              allocator<sub_match<_Bi_iter> >> size_type std::match_results<  
              _Bi_iter, _Allocator >::max_size( ) const  [inline]
```

Gets the number of matches and submatches.

The number of matches for a given regular expression will be either 0 if there was no match or `mark_count()` + 1 if a match was successful. Some matches may be empty.

Returns

the number of matches found.

Reimplemented from [std::vector< std::sub_match< _Bi_iter >, _Allocator >](#).

Definition at line 1546 of file `regex.h`.

```
5.549.3.11  template<typename _Bi_iter, typename _Allocator =  
              allocator<sub_match<_Bi_iter> >> match_results&  
              std::match_results< _Bi_iter, _Allocator >::operator=( const  
              match_results< _Bi_iter, _Allocator > __rhs )  [inline]
```

Assigns `rhs` to `*this`.

Definition at line 1510 of file `regex.h`.

```
5.549.3.12  template<typename _Bi_iter, typename _Allocator =  
              allocator<sub_match<_Bi_iter> >> const_reference  
              std::match_results< _Bi_iter, _Allocator >::operator[] ( size_type  
              __sub ) const  [inline]
```

Gets a `sub_match` reference for the match or submatch.

Parameters

sub indicates the submatch.

This function gets a reference to the indicated submatch, or the entire match if `sub` is zero.

If `sub >= size()` then this function returns a `sub_match` with a special value indicating no submatch.

Definition at line 1617 of file `regex.h`.

5.549.3.13 `template<typename _Bi_iter, typename _Allocator =
allocator<sub_match<_Bi_iter> >> difference_type
std::match_results< _Bi_iter, _Allocator >::position (size_type
__sub = 0) const [inline]`

Gets the offset of the beginning of the indicated submatch.

Parameters

sub indicates the submatch.

This function returns the offset from the beginning of the target sequence to the beginning of the submatch, unless the value of *sub* is zero (the default), in which case this function returns the offset from the beginning of the target sequence to the beginning of the match.

Returns -1 if *sub* is out of range.

Definition at line 1589 of file `regex.h`.

5.549.3.14 `template<typename _Bi_iter, typename _Allocator =
allocator<sub_match<_Bi_iter> >> const_reference
std::match_results< _Bi_iter, _Allocator >::prefix () const
[inline]`

Gets a `sub_match` representing the match prefix.

This function gets a reference to a `sub_match` object representing the part of the target range between the start of the target range and the start of the match.

Definition at line 1632 of file `regex.h`.

Referenced by `std::match_results< _FwdIterT, _Alloc >::position()`.

5.549.3.15 `template<typename _Bi_iter, typename _Allocator =
allocator<sub_match<_Bi_iter> >> size_type std::match_results<
_Bi_iter, _Allocator >::size () const [inline]`

Gets the number of matches and submatches.

The number of matches for a given regular expression will be either 0 if there was no match or `mark_count() + 1` if a match was successful. Some matches may be empty.

Returns

the number of matches found.

Reimplemented from `std::vector< std::sub_match< _Bi_iter >, _Allocator >`.

5.549 std::match_results< _Bi_iter, _Allocator > Class Template Reference 2689

Definition at line 1539 of file regex.h.

Referenced by std::match_results< _FwdIterT, _Alloc >::operator[](), and std::match_results< _FwdIterT, _Alloc >::position().

```
5.549.3.16 template<typename _Bi_iter, typename _Allocator
= allocator<sub_match<_Bi_iter> >> string_type
std::match_results< _Bi_iter, _Allocator >::str ( size_type __sub =
0 ) const [inline]
```

Gets the match or submatch converted to a string type.

Parameters

sub indicates the submatch.

This function gets the submatch (or match, if *sub* is zero) extracted from the target range and converted to the associated string type.

Definition at line 1603 of file regex.h.

```
5.549.3.17 template<typename _Bi_iter, typename _Allocator =
allocator<sub_match<_Bi_iter> >> const_reference
std::match_results< _Bi_iter, _Allocator >::suffix ( ) const
[inline]
```

Gets a sub_match representing the match suffix.

This function gets a reference to a sub_match object representing the part of the target range between the end of the match and the end of the target range.

Definition at line 1647 of file regex.h.

```
5.549.3.18 template<typename _Bi_iter, typename _Allocator =
allocator<sub_match<_Bi_iter> >> void std::match_results<
_Bi_iter, _Allocator >::swap ( match_results< _Bi_iter, _Allocator
> & __that ) [inline]
```

Swaps the contents of two [match_results](#).

Definition at line 1745 of file regex.h.

Referenced by std::swap().

5.554.1 Detailed Description

`template<typename _CharT> class std::messages<_CharT>`

Primary class template messages.

This facet encapsulates the code to retrieve messages from message catalogs. The only thing defined by the standard for this facet is the interface. All underlying functionality is implementation-defined. This library currently implements 3 versions of the message facet. The first version (gnu) is a wrapper around gettext, provided by libintl. The

second version (ieee) is a wrapper around catgets. The final version (default) does no actual translation. These implementations are only provided for char and wchar_t instantiations.

The messages template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the messages facet.

Definition at line 1690 of file locale_facets_nonio.h.

5.554.2 Member Typedef Documentation

5.554.2.1 `template<typename _CharT > typedef _CharT std::messages<_CharT >::char_type`

Public typedefs.

5.560.3 Constructor & Destructor Documentation

5.560.3.1 `template<typename _CharT, typename _InIter> std::money_get<_CharT, _InIter>::money_get (size_t __refs = 0) [inline, explicit]`

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

refs Passed to the base facet class.

Definition at line 1387 of file locale_facets_nonio.h.

5.560.3.2 `template<typename _CharT, typename _InIter> virtual std::money_get<_CharT, _InIter>::~~money_get () [inline, protected, virtual]`

Destructor.

Definition at line 1455 of file locale_facets_nonio.h.

5.560.4 Member Function Documentation

5.560.4.1 `template<typename _CharT, typename _InIter> _InIter std::money_get<_CharT, _InIter>::do_get (iter_type __s, iter_type __end, bool __intl, ios_base & __io, ios_base::iostate & __err, long double & __units) const [protected, virtual]`

Read and parse a monetary value.

This function reads and parses characters representing a monetary value. This function is a hook for derived classes to change the value returned.

See also

[get\(\)](#) for details.

Definition at line 363 of file locale_facets_nonio.tcc.

References `std::basic_string<_CharT, _Traits, _Alloc>::c_str()`.

Referenced by `std::money_get<_CharT, _InIter>::get()`.

```

5.560.4.2 template<typename _CharT, typename _InIter > _InIter
std::money_get< _CharT, _InIter >::do_get ( iter_type __s,
iter_type __end, bool __intl, ios_base & __io, ios_base::iostate &
__err, string_type & __digits ) const [protected, virtual]

```

Read and parse a monetary value.

This function reads and parses characters representing a monetary value. This function is a hook for derived classes to change the value returned.

See also

[get\(\)](#) for details.

Definition at line 376 of file locale_facets_nonio.tcc.

References `std::ios_base::M_getloc()`, `std::basic_string< _CharT, _Traits, _Alloc >::resize()`, and `std::__ctype_abstract_base< _CharT >::widen()`.

```

5.560.4.3 template<typename _CharT, typename _InIter > iter_type
std::money_get< _CharT, _InIter >::get ( iter_type __s, iter_type
__end, bool __intl, ios_base & __io, ios_base::iostate & __err,
string_type & __digits ) const [inline]

```

Read and parse a monetary value.

This function reads characters from *s*, interprets them as a monetary value according to `moneypunct` and `ctype` facets retrieved from `io.getloc()`, and returns the result in *digits*. For example, the string \$10.01 in a US locale would store 1001 in *digits*.

Any characters not part of a valid money amount are not consumed.

If a money value cannot be parsed from the input stream, sets `err=(err|io.failbit)`. If the stream is consumed before finishing parsing, sets `err=(err|io.failbit|io.eofbit)`.

This function works by returning the result of [do_get\(\)](#).

Parameters

- s* Start of characters to parse.
- end* End of characters to parse.
- intl* Parameter to use `_facet<moneypunct<CharT,intl>>`.
- io* Source of facets and io state.
- err* Error field to set if parsing fails.
- digits* Place to store result of parsing.

Returns

Iterator referencing first character beyond valid money amount.

Definition at line 1448 of file locale_facets_nonio.h.

References `std::money_get<_CharT, _InIter>::do_get()`.

5.560.4.4 `template<typename _CharT, typename _InIter> iter_type
std::money_get<_CharT, _InIter>::get (iter_type __s, iter_type
__end, bool __intl, ios_base & __io, ios_base::iostate & __err, long
double & __units) const [inline]`

Read and parse a monetary value.

This function reads characters from *s*, interprets them as a monetary value according to `moneypunct` and `ctype` facets retrieved from `io.getloc()`, and returns the result in *units* as an integral value `moneypunct::frac_digits()` * the actual amount. For example, the string \$10.01 in a US locale would store 1001 in *units*.

Any characters not part of a valid money amount are not consumed.

If a money value cannot be parsed from the input stream, sets `err=(err|io.failbit)`. If the stream is consumed before finishing parsing, sets `err=(err|io.failbit|io.eofbit)`. *units* is unchanged if parsing fails.

This function works by returning the result of `do_get()`.

Parameters

- s* Start of characters to parse.
- end* End of characters to parse.
- intl* Parameter to use `_facet<moneypunct<CharT,intl>>`.
- io* Source of facets and io state.
- err* Error field to set if parsing fails.
- units* Place to store result of parsing.

Returns

Iterator referencing first character beyond valid money amount.

Definition at line 1417 of file locale_facets_nonio.h.

References `std::money_get<_CharT, _InIter>::do_get()`.

5.561.1 Detailed Description

template<typename _CharT, typename _OutIter> class std::money_put< _CharT, _OutIter >

Primary class template [money_put](#).

This facet encapsulates the code to format and output a monetary amount. The [money_put](#) template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the [money_put](#) facet.

Definition at line 1516 of file [locale_facets_nonio.h](#).

5.561.2 Member Typedef Documentation

5.561.2.1 `template<typename _CharT, typename _OutIter > typedef _CharT
std::money_put< _CharT, _OutIter >::char_type`

Public typedefs.

Definition at line 1521 of file locale_facets_nonio.h.

5.561.2.2 `template<typename _CharT, typename _OutIter > typedef _OutIter
std::money_put< _CharT, _OutIter >::iter_type`

Public typedefs.

Definition at line 1522 of file locale_facets_nonio.h.

5.561.2.3 `template<typename _CharT, typename _OutIter > typedef
basic_string<_CharT> std::money_put< _CharT, _OutIter
>::string_type`

Public typedefs.

Definition at line 1523 of file locale_facets_nonio.h.

5.561.3 Constructor & Destructor Documentation

5.561.3.1 `template<typename _CharT, typename _OutIter >
std::money_put< _CharT, _OutIter >::money_put (size_t __refs =
0) [inline, explicit]`

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

refs Passed to the base facet class.

Definition at line 1537 of file locale_facets_nonio.h.

5.561.3.2 `template<typename _CharT, typename _OutIter > virtual
std::money_put< _CharT, _OutIter >::~~money_put ()
[inline, protected, virtual]`

Destructor.

Definition at line 1587 of file locale_facets_nonio.h.

5.561.4 Member Function Documentation

5.561.4.1 `template<typename _CharT, typename _OutIter > _OutIter
std::money_put<_CharT, _OutIter >::do_put (iter_type __s, bool
__intl, ios_base & __io, char_type __fill, long double __units)
const [protected, virtual]`

Format and output a monetary value.

This function formats *units* as a monetary value according to moneypunct and ctype facets retrieved from io.getloc(), and writes the resulting characters to *s*. For example, the value 1001 in a US locale would write \$10.01 to *s*.

This function is a hook for derived classes to change the value returned.

See also

[put\(\)](#).

Parameters

s The stream to write to.

intl Parameter to use_facet<moneypunct<CharT,intl> >.

io Source of facets and io state.

fill char_type to use for padding.

units Place to store result of parsing.

Returns

Iterator after writing.

Definition at line 568 of file locale_facets_nonio.tcc.

References `std::ios_base::getloc()`, and `std::__ctype_abstract_base<_CharT >::widen()`.

Referenced by `std::money_put<_CharT, _OutIter >::put()`.

5.561.4.2 `template<typename _CharT, typename _OutIter > _OutIter
std::money_put<_CharT, _OutIter >::do_put (iter_type __s, bool
__intl, ios_base & __io, char_type __fill, const string_type &
__digits) const [protected, virtual]`

Format and output a monetary value.

This function formats *digits* as a monetary value according to `moneypunct` and `ctype` facets retrieved from `io.getloc()`, and writes the resulting characters to *s*. For example, the string `1001` in a US locale would write `$10.01` to *s*.

This function is a hook for derived classes to change the value returned.

See also

[put\(\)](#).

Parameters

s The stream to write to.

intl Parameter to use `_facet<moneypunct<CharT,intl>>`.

io Source of facets and io state.

fill `char_type` to use for padding.

units Place to store result of parsing.

Returns

Iterator after writing.

Definition at line 606 of file `locale_facets_nonio.tcc`.

5.561.4.3 `template<typename _CharT, typename _OutIter> iter_type
std::money_put<_CharT, _OutIter>::put (iter_type __s, bool
__intl, ios_base & __io, char_type __fill, const string_type &
__digits) const [inline]`

Format and output a monetary value.

This function formats *digits* as a monetary value according to `moneypunct` and `ctype` facets retrieved from `io.getloc()`, and writes the resulting characters to *s*. For example, the string `1001` in a US locale would write `$10.01` to *s*.

This function works by returning the result of [do_put\(\)](#).

Parameters

s The stream to write to.

intl Parameter to use `_facet<moneypunct<CharT,intl>>`.

io Source of facets and io state.

fill `char_type` to use for padding.

units Place to store result of parsing.

Returns

Iterator after writing.

Definition at line 1580 of file locale_facets_nonio.h.

References `std::money_put<_CharT, _OutIter >::do_put()`.

5.561.4.4 `template<typename _CharT, typename _OutIter > iter_type
std::money_put<_CharT, _OutIter >::put (iter_type __s, bool
__intl, ios_base & __io, char_type __fill, long double __units)
const [inline]`

Format and output a monetary value.

This function formats *units* as a monetary value according to `moneypunct` and `ctype` facets retrieved from `io.getloc()`, and writes the resulting characters to *s*. For example, the value 1001 in a US locale would write \$10.01 to *s*.

This function works by returning the result of `do_put()`.

Parameters

s The stream to write to.

intl Parameter to use `_facet<moneypunct<CharT,intl> >`.

io Source of facets and io state.

fill `char_type` to use for padding.

units Place to store result of parsing.

Returns

Iterator after writing.

Definition at line 1557 of file locale_facets_nonio.h.

References `std::money_put<_CharT, _OutIter >::do_put()`.

5.562.1 Detailed Description

`template<typename _CharT, bool _Intl> class std::moneypunct< _CharT, _Intl >`

Primary class template `moneypunct`.

This facet encapsulates the punctuation, grouping and other formatting features of money amount string representations.

Definition at line 929 of file `locale_facets_nonio.h`.

5.562.2 Member Typedef Documentation

5.562.2.1 `template<typename _CharT, bool _Intl> typedef _CharT std::moneypunct< _CharT, _Intl >::char_type`

Public typedefs.

Reimplemented in `std::moneypunct_byname< _CharT, _Intl >`.

Definition at line 935 of file `locale_facets_nonio.h`.

5.562.2.2 `template<typename _CharT, bool _Intl> typedef
basic_string<_CharT> std::moneypunct<_CharT, _Intl
>::string_type`

Public typedefs.

Reimplemented in [std::moneypunct_byname<_CharT, _Intl>](#).

Definition at line 936 of file locale_facets_nonio.h.

5.562.3 Constructor & Destructor Documentation

5.562.3.1 `template<typename _CharT, bool _Intl> std::moneypunct<_CharT,
_Intl>::moneypunct (size_t __refs = 0) [inline, explicit]`

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

refs Passed to the base facet class.

Definition at line 958 of file locale_facets_nonio.h.

5.562.3.2 `template<typename _CharT, bool _Intl> std::moneypunct<_CharT,
_Intl>::moneypunct (__cache_type * __cache, size_t __refs = 0)
[inline, explicit]`

Constructor performs initialization.

This is an internal constructor.

Parameters

cache Cache for optimization.

refs Passed to the base facet class.

Definition at line 971 of file locale_facets_nonio.h.

5.562.3.3 `template<typename _CharT, bool _Intl> std::moneypunct<_CharT,
_Intl>::moneypunct (__c_locale __cloc, const char * __s, size_t
__refs = 0) [inline, explicit]`

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up new locales.

Parameters

- cloc* The C locale.
- s* The name of a locale.
- refs* Passed to the base facet class.

Definition at line 986 of file locale_facets_nonio.h.

5.562.3.4 `template<typename _CharT, bool _Intl> virtual std::moneypunct<_CharT, _Intl >::~~moneypunct () [protected, virtual]`

Destructor.

5.562.4 Member Function Documentation

5.562.4.1 `template<typename _CharT, bool _Intl> string_type std::moneypunct< _CharT, _Intl >::curr_symbol () const [inline]`

Return currency symbol string.

This function returns a `string_type` to use as a currency symbol. It does so by returning returning `moneypunct<char_type>::do_curr_symbol()`.

Returns

string_type representing a currency symbol.

Definition at line 1056 of file locale_facets_nonio.h.

References `std::moneypunct< _CharT, _Intl >::do_curr_symbol()`.

5.562.4.2 `template<typename _CharT, bool _Intl> char_type std::moneypunct< _CharT, _Intl >::decimal_point () const [inline]`

Return decimal point character.

This function returns a `char_type` to use as a decimal point. It does so by returning returning `moneypunct<char_type>::do_decimal_point()`.

Returns

char_type representing a decimal point.

Definition at line 1000 of file locale_facets_nonio.h.

References `std::moneypunct< _CharT, _Intl >::do_decimal_point()`.

5.562.4.3 `template<typename _CharT, bool _Intl> virtual string_type
std::moneypunct< _CharT, _Intl >::do_curr_symbol () const
[inline, protected, virtual]`

Return currency symbol string.

This function returns a `string_type` to use as a currency symbol. This function is a hook for derived classes to change the value returned.

See also

[curr_symbol\(\)](#) for details.

Returns

string_type representing a currency symbol.

Definition at line 1202 of file `locale_facets_nonio.h`.

Referenced by `std::moneypunct< _CharT, _Intl >::curr_symbol()`.

5.562.4.4 `template<typename _CharT, bool _Intl> virtual char_type
std::moneypunct< _CharT, _Intl >::do_decimal_point () const
[inline, protected, virtual]`

Return decimal point character.

Returns a `char_type` to use as a decimal point. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a decimal point.

Definition at line 1164 of file `locale_facets_nonio.h`.

Referenced by `std::moneypunct< _CharT, _Intl >::decimal_point()`.

5.562.4.5 `template<typename _CharT, bool _Intl> virtual int
std::moneypunct< _CharT, _Intl >::do_frac_digits () const
[inline, protected, virtual]`

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. This function is a hook for derived classes to change the value returned.

See also

[frac_digits\(\)](#) for details.

Returns

Number of digits in amount fraction.

Definition at line 1242 of file locale_facets_nonio.h.

Referenced by std::moneypunct< _CharT, _Intl >::frac_digits().

5.562.4.6 `template<typename _CharT, bool _Intl> virtual string
std::moneypunct< _CharT, _Intl >::do_grouping () const
[inline, protected, virtual]`

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

See also

[grouping\(\)](#) for details.

Returns

String representing grouping specification.

Definition at line 1189 of file locale_facets_nonio.h.

Referenced by std::moneypunct< _CharT, _Intl >::grouping().

5.562.4.7 `template<typename _CharT, bool _Intl> virtual pattern
std::moneypunct< _CharT, _Intl >::do_neg_format () const
[inline, protected, virtual]`

Return pattern for money values.

This function returns a pattern describing the formatting of a negative valued money amount. This function is a hook for derived classes to change the value returned.

See also

[neg_format\(\)](#) for details.

Returns

Pattern for money values.

Definition at line 1270 of file locale_facets_nonio.h.

Referenced by std::moneypunct< _CharT, _Intl >::neg_format().

5.562.4.8 `template<typename _CharT, bool _Intl> virtual string_type
std::moneypunct< _CharT, _Intl >::do_negative_sign () const
[inline, protected, virtual]`

Return negative sign string.

This function returns a `string_type` to use as a sign for negative amounts. This function is a hook for derived classes to change the value returned.

See also

[negative_sign\(\)](#) for details.

Returns

string_type representing a negative sign.

Definition at line 1228 of file `locale_facets_nonio.h`.

Referenced by `std::moneypunct< _CharT, _Intl >::negative_sign()`.

5.562.4.9 `template<typename _CharT, bool _Intl> virtual pattern
std::moneypunct< _CharT, _Intl >::do_pos_format () const
[inline, protected, virtual]`

Return pattern for money values.

This function returns a pattern describing the formatting of a positive valued money amount. This function is a hook for derived classes to change the value returned.

See also

[pos_format\(\)](#) for details.

Returns

Pattern for money values.

Definition at line 1256 of file `locale_facets_nonio.h`.

Referenced by `std::moneypunct< _CharT, _Intl >::pos_format()`.

5.562.4.10 `template<typename _CharT, bool _Intl> virtual string_type
std::moneypunct< _CharT, _Intl >::do_positive_sign () const
[inline, protected, virtual]`

Return positive sign string.

This function returns a `string_type` to use as a sign for positive amounts. This function is a hook for derived classes to change the value returned.

See also

[positive_sign\(\)](#) for details.

Returns

string_type representing a positive sign.

Definition at line 1215 of file locale_facets_nonio.h.

Referenced by std::moneypunct< _CharT, _Intl >::positive_sign().

5.562.4.11 `template<typename _CharT, bool _Intl> virtual char_type
std::moneypunct< _CharT, _Intl >::do_thousands_sep () const
[inline, protected, virtual]`

Return thousands separator character.

Returns a char_type to use as a thousands separator. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a thousands separator.

Definition at line 1176 of file locale_facets_nonio.h.

Referenced by std::moneypunct< _CharT, _Intl >::thousands_sep().

5.562.4.12 `template<typename _CharT, bool _Intl> int std::moneypunct<
_CharT, _Intl >::frac_digits () const [inline]`

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. It does so by returning returning [moneypunct<char_type>::do_frac_digits\(\)](#).

The fractional part of a money amount is optional. But if it is present, there must be [frac_digits\(\)](#) digits.

Returns

Number of digits in amount fraction.

Definition at line 1106 of file locale_facets_nonio.h.

References std::moneypunct< _CharT, _Intl >::do_frac_digits().

5.562.4.13 `template<typename _CharT, bool _Intl> string std::moneypunct<_CharT, _Intl>::grouping () const [inline]`

Return grouping specification.

This function returns a string representing groupings for the integer part of an amount. Groupings indicate where thousands separators should be inserted.

Each char in the return string is interpreted as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the `grouping()` returns `32` and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was `32`, this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling `moneypunct<char_type>::do_grouping()`.

Returns

string representing grouping specification.

Definition at line 1043 of file `locale_facets_nonio.h`.

References `std::moneypunct<_CharT, _Intl>::do_grouping()`.

5.562.4.14 `template<typename _CharT, bool _Intl> pattern std::moneypunct<_CharT, _Intl>::neg_format () const [inline]`

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning `moneypunct<char_type>::do_pos_format()` or `moneypunct<char_type>::do_neg_format()`.

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of `curr_symbol()` may be present. The sign field indicates that the value of `positive_sign()` or `negative_sign()` must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and `pos_format()` pattern {symbol,sign,value,none},

`curr_symbol()` == '\$' `positive_sign()` == '+', and value 10.01, and options set to force the symbol, the corresponding string is \$+10.01.

Returns

Pattern for money values.

Definition at line 1146 of file locale_facets_nonio.h.

References `std::moneypunct< _CharT, _Intl >::do_neg_format()`.

5.562.4.15 `template<typename _CharT, bool _Intl> string_type
std::moneypunct< _CharT, _Intl >::negative_sign () const
[inline]`

Return negative sign string.

This function returns a `string_type` to use as a sign for negative amounts. It does so by returning `moneypunct<char_type>::do_negative_sign()`.

If the return value contains more than one character, the first character appears in the position indicated by `neg_format()` and the remainder appear at the end of the formatted string.

Returns

string_type representing a negative sign.

Definition at line 1090 of file locale_facets_nonio.h.

References `std::moneypunct< _CharT, _Intl >::do_negative_sign()`.

5.562.4.16 `template<typename _CharT, bool _Intl> pattern std::moneypunct<
_CharT, _Intl >::pos_format () const [inline]`

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning `moneypunct<char_type>::do_pos_format()` or `moneypunct<char_type>::do_neg_format()`.

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of `curr_symbol()` may be present. The sign field indicates that the value of `positive_sign()` or `negative_sign()` must be

present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and `pos_format()` pattern {symbol,sign,value,none}, `curr_symbol() == '$'` `positive_sign() == '+'`, and value 10.01, and options set to force the symbol, the corresponding string is \$+10.01.

Returns

Pattern for money values.

Definition at line 1142 of file `locale_facets_nonio.h`.

References `std::moneypunct<_CharT, _Intl>::do_pos_format()`.

5.562.4.17 `template<typename _CharT, bool _Intl> string_type
std::moneypunct<_CharT, _Intl>::positive_sign () const
[inline]`

Return positive sign string.

This function returns a `string_type` to use as a sign for positive amounts. It does so by returning `moneypunct<char_type>::do_positive_sign()`.

If the return value contains more than one character, the first character appears in the position indicated by `pos_format()` and the remainder appear at the end of the formatted string.

Returns

string_type representing a positive sign.

Definition at line 1073 of file `locale_facets_nonio.h`.

References `std::moneypunct<_CharT, _Intl>::do_positive_sign()`.

5.562.4.18 `template<typename _CharT, bool _Intl> char_type
std::moneypunct<_CharT, _Intl>::thousands_sep () const
[inline]`

Return thousands separator character.

This function returns a `char_type` to use as a thousands separator. It does so by returning `moneypunct<char_type>::do_thousands_sep()`.

Returns

`char_type` representing a thousands separator.

5.563 std::moneypunct_byname< _CharT, _Intl > Class Template Reference

Definition at line 1323 of file locale_facets_nonio.h.

5.563.3 Member Function Documentation

5.563.3.1 `template<typename _CharT, bool _Intl> string_type
std::moneypunct<_CharT, _Intl>::curr_symbol () const
[inline, inherited]`

Return currency symbol string.

This function returns a `string_type` to use as a currency symbol. It does so by returning [returning moneypunct<char_type>::do_curr_symbol\(\)](#).

Returns

string_type representing a currency symbol.

Definition at line 1056 of file `locale_facets_nonio.h`.

References `std::moneypunct<_CharT, _Intl>::do_curr_symbol()`.

5.563.3.2 `template<typename _CharT, bool _Intl> char_type
std::moneypunct<_CharT, _Intl>::decimal_point () const
[inline, inherited]`

Return decimal point character.

This function returns a `char_type` to use as a decimal point. It does so by returning [returning moneypunct<char_type>::do_decimal_point\(\)](#).

Returns

char_type representing a decimal point.

Definition at line 1000 of file `locale_facets_nonio.h`.

References `std::moneypunct<_CharT, _Intl>::do_decimal_point()`.

5.563.3.3 `template<typename _CharT, bool _Intl> virtual string_type
std::moneypunct<_CharT, _Intl>::do_curr_symbol () const
[inline, protected, virtual, inherited]`

Return currency symbol string.

This function returns a `string_type` to use as a currency symbol. This function is a hook for derived classes to change the value returned.

See also

[curr_symbol\(\)](#) for details.

Returns

string_type representing a currency symbol.

Definition at line 1202 of file locale_facets_nonio.h.

Referenced by `std::moneypunct<_CharT, _Intl >::curr_symbol()`.

5.563.3.4 `template<typename _CharT, bool _Intl> virtual char_type
std::moneypunct<_CharT, _Intl >::do_decimal_point () const
[inline, protected, virtual, inherited]`

Return decimal point character.

Returns a `char_type` to use as a decimal point. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a decimal point.

Definition at line 1164 of file locale_facets_nonio.h.

Referenced by `std::moneypunct<_CharT, _Intl >::decimal_point()`.

5.563.3.5 `template<typename _CharT, bool _Intl> virtual int
std::moneypunct<_CharT, _Intl >::do_frac_digits () const
[inline, protected, virtual, inherited]`

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. This function is a hook for derived classes to change the value returned.

See also

[frac_digits\(\)](#) for details.

Returns

Number of digits in amount fraction.

Definition at line 1242 of file locale_facets_nonio.h.

Referenced by `std::moneypunct<_CharT, _Intl >::frac_digits()`.

5.563 std::moneypunct_byname<_CharT, _Intl> Class Template Reference 2741

5.563.3.6 `template<typename _CharT, bool _Intl> virtual string
std::moneypunct<_CharT, _Intl>::do_grouping () const
[inline, protected, virtual, inherited]`

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

See also

[grouping\(\)](#) for details.

Returns

String representing grouping specification.

Definition at line 1189 of file locale_facets_nonio.h.

Referenced by std::moneypunct<_CharT, _Intl>::grouping().

5.563.3.7 `template<typename _CharT, bool _Intl> virtual pattern
std::moneypunct<_CharT, _Intl>::do_neg_format () const
[inline, protected, virtual, inherited]`

Return pattern for money values.

This function returns a pattern describing the formatting of a negative valued money amount. This function is a hook for derived classes to change the value returned.

See also

[neg_format\(\)](#) for details.

Returns

Pattern for money values.

Definition at line 1270 of file locale_facets_nonio.h.

Referenced by std::moneypunct<_CharT, _Intl>::neg_format().

5.563.3.8 `template<typename _CharT, bool _Intl> virtual string_type
std::moneypunct<_CharT, _Intl>::do_negative_sign () const
[inline, protected, virtual, inherited]`

Return negative sign string.

This function returns a string_type to use as a sign for negative amounts. This function is a hook for derived classes to change the value returned.

See also

[negative_sign\(\)](#) for details.

Returns

string_type representing a negative sign.

Definition at line 1228 of file `locale_facets_nonio.h`.

Referenced by `std::moneypunct<_CharT, _Intl >::negative_sign()`.

5.563.3.9 `template<typename _CharT, bool _Intl> virtual pattern
std::moneypunct<_CharT, _Intl >::do_pos_format () const
[inline, protected, virtual, inherited]`

Return pattern for money values.

This function returns a pattern describing the formatting of a positive valued money amount. This function is a hook for derived classes to change the value returned.

See also

[pos_format\(\)](#) for details.

Returns

Pattern for money values.

Definition at line 1256 of file `locale_facets_nonio.h`.

Referenced by `std::moneypunct<_CharT, _Intl >::pos_format()`.

5.563.3.10 `template<typename _CharT, bool _Intl> virtual string_type
std::moneypunct<_CharT, _Intl >::do_positive_sign () const
[inline, protected, virtual, inherited]`

Return positive sign string.

This function returns a *string_type* to use as a sign for positive amounts. This function is a hook for derived classes to change the value returned.

See also

[positive_sign\(\)](#) for details.

Returns

string_type representing a positive sign.

5.563 std::moneypunct_byname<_CharT, _Intl> Class Template Reference2743

Definition at line 1215 of file locale_facets_nonio.h.

Referenced by std::moneypunct<_CharT, _Intl>::positive_sign().

5.563.3.11 `template<typename _CharT, bool _Intl> virtual char_type
std::moneypunct<_CharT, _Intl>::do_thousands_sep() const
[inline, protected, virtual, inherited]`

Return thousands separator character.

Returns a char_type to use as a thousands separator. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a thousands separator.

Definition at line 1176 of file locale_facets_nonio.h.

Referenced by std::moneypunct<_CharT, _Intl>::thousands_sep().

5.563.3.12 `template<typename _CharT, bool _Intl> int std::moneypunct<
_CharT, _Intl>::frac_digits() const [inline, inherited]`

Return number of digits in fraction.

This function returns the exact number of digits that make up the fractional part of a money amount. It does so by returning returning [moneypunct<char_type>::do_frac_digits\(\)](#).

The fractional part of a money amount is optional. But if it is present, there must be [frac_digits\(\)](#) digits.

Returns

Number of digits in amount fraction.

Definition at line 1106 of file locale_facets_nonio.h.

References std::moneypunct<_CharT, _Intl>::do_frac_digits().

5.563.3.13 `template<typename _CharT, bool _Intl> string std::moneypunct<
_CharT, _Intl>::grouping() const [inline, inherited]`

Return grouping specification.

This function returns a string representing groupings for the integer part of an amount. Groupings indicate where thousands separators should be inserted.

Each char in the return string is interpreted as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the [grouping\(\)](#) returns `32` and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was `32`, this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling [moneypunct<char_type>::do_grouping\(\)](#).

Returns

string representing grouping specification.

Definition at line 1043 of file `locale_facets_nonio.h`.

References `std::moneypunct<_CharT, _Intl>::do_grouping()`.

5.563.3.14 `template<typename _CharT, bool _Intl> pattern std::moneypunct<_CharT, _Intl>::neg_format() const [inline, inherited]`

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning [moneypunct<char_type>::do_pos_format\(\)](#) or [moneypunct<char_type>::do_neg_format\(\)](#).

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of [curr_symbol\(\)](#) may be present. The sign field indicates that the value of [positive_sign\(\)](#) or [negative_sign\(\)](#) must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and [pos_format\(\)](#) pattern {symbol,sign,value,none}, [curr_symbol\(\)](#) == '\$' [positive_sign\(\)](#) == '+', and value 10.01, and options set to force the symbol, the corresponding string is \$+10.01.

Returns

Pattern for money values.

Definition at line 1146 of file `locale_facets_nonio.h`.

5.563 std::moneypunct_byname<_CharT, _Intl> Class Template Reference 2745

References std::moneypunct<_CharT, _Intl>::do_neg_format().

5.563.3.15 `template<typename _CharT, bool _Intl> string_type
std::moneypunct<_CharT, _Intl>::negative_sign () const
[inline, inherited]`

Return negative sign string.

This function returns a string_type to use as a sign for negative amounts. It does so by returning returning [moneypunct<char_type>::do_negative_sign\(\)](#).

If the return value contains more than one character, the first character appears in the position indicated by [neg_format\(\)](#) and the remainder appear at the end of the formatted string.

Returns

string_type representing a negative sign.

Definition at line 1090 of file locale_facets_nonio.h.

References std::moneypunct<_CharT, _Intl>::do_negative_sign().

5.563.3.16 `template<typename _CharT, bool _Intl> pattern std::moneypunct<
_CharT, _Intl>::pos_format () const [inline, inherited]`

Return pattern for money values.

This function returns a pattern describing the formatting of a positive or negative valued money amount. It does so by returning returning [moneypunct<char_type>::do_pos_format\(\)](#) or [moneypunct<char_type>::do_neg_format\(\)](#).

The pattern has 4 fields describing the ordering of symbol, sign, value, and none or space. There must be one of each in the pattern. The none and space enums may not appear in the first field and space may not appear in the final field.

The parts of a money string must appear in the order indicated by the fields of the pattern. The symbol field indicates that the value of [curr_symbol\(\)](#) may be present. The sign field indicates that the value of [positive_sign\(\)](#) or [negative_sign\(\)](#) must be present. The value field indicates that the absolute value of the money amount is present. none indicates 0 or more whitespace characters, except at the end, where it permits no whitespace. space indicates that 1 or more whitespace characters must be present.

For example, for the US locale and [pos_format\(\)](#) pattern {symbol,sign,value,none}, [curr_symbol\(\)](#) == '\$' [positive_sign\(\)](#) == '+', and value 10.01, and options set to force the symbol, the corresponding string is \$+10.01.

Returns

Pattern for money values.

Definition at line 1142 of file locale_facets_nonio.h.

References `std::moneypunct<_CharT, _Intl >::do_pos_format()`.

5.563.3.17 `template<typename _CharT, bool _Intl> string_type
std::moneypunct<_CharT, _Intl >::positive_sign () const
[inline, inherited]`

Return positive sign string.

This function returns a `string_type` to use as a sign for positive amounts. It does so by returning `moneypunct<char_type>::do_positive_sign()`.

If the return value contains more than one character, the first character appears in the position indicated by `pos_format()` and the remainder appear at the end of the formatted string.

Returns

string_type representing a positive sign.

Definition at line 1073 of file locale_facets_nonio.h.

References `std::moneypunct<_CharT, _Intl >::do_positive_sign()`.

5.563.3.18 `template<typename _CharT, bool _Intl> char_type
std::moneypunct<_CharT, _Intl >::thousands_sep () const
[inline, inherited]`

Return thousands separator character.

This function returns a `char_type` to use as a thousands separator. It does so by returning `moneypunct<char_type>::do_thousands_sep()`.

Returns

`char_type` representing a thousands separator.

Definition at line 1013 of file locale_facets_nonio.h.

References `std::moneypunct<_CharT, _Intl >::do_thousands_sep()`.

5.563.4 Member Data Documentation

5.563.4.1 `template<typename _CharT, bool _Intl> locale::id`

5.564.1 Detailed Description

template<typename _Iterator> class std::move_iterator< _Iterator >

Class template [move_iterator](#) is an iterator adapter with the same behavior as the underlying iterator except that its dereference operator implicitly converts the value returned by the underlying iterator's dereference operator to an rvalue reference. Some generic algorithms can be called with move iterators to replace copying with moving.

Definition at line 916 of file stl_iterator.h.

The documentation for this class was generated from the following file:

- [stl_iterator.h](#)

bool **operator**== (const `multimap`< _K1, _T1, _C1, _A1 > &, const `multimap`< _K1, _T1, _C1, _A1 > &)

5.565.1 Detailed Description

```
template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> class
std::multimap< _Key, _Tp, _Compare, _Alloc >
```

A standard container made up of (key,value) pairs, which can be retrieved based on a key, in logarithmic time. Meets the requirements of a [container](#), a [reversible container](#), and an [associative container](#) (using equivalent keys). For a `multimap<Key, T>` the `key_type` is `Key`, the `mapped_type` is `T`, and the `value_type` is `std::pair<const Key,T>`.

Multimaps support bidirectional iterators.

The private tree data is declared exactly the same way for `map` and `multimap`; the distinction is made entirely in how the tree functions are called (`*_unique` versus `*_equal`, same as the standard).

Definition at line 86 of file `stl_multimap.h`.

5.565.2 Constructor & Destructor Documentation

5.565.2.1 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap() [inline]`

Default constructor creates no elements.

Definition at line 148 of file `stl_multimap.h`.

5.565.2.2 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap(const _Compare & __comp, const allocator_type & __a = allocator_type()) [inline, explicit]`

Creates a multimap with no elements.

Parameters

comp A comparison object.

a An allocator object.

Definition at line 157 of file `stl_multimap.h`.

```

5.565.2.3  template<typename _Key, typename _Tp, typename _Compare =
            std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
            _Key, _Tp>>> std::multimap<_Key, _Tp, _Compare, _Alloc
            >::multimap ( const multimap<_Key, _Tp, _Compare, _Alloc > &
            __x ) [inline]

```

Multimap copy constructor.

Parameters

x A multimap of identical element and allocator types.

The newly-created multimap uses a copy of the allocation object used by *x*.

Definition at line 168 of file `stl_multimap.h`.

```

5.565.2.4  template<typename _Key, typename _Tp, typename _Compare =
            std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
            _Key, _Tp>>> std::multimap<_Key, _Tp, _Compare, _Alloc
            >::multimap ( multimap<_Key, _Tp, _Compare, _Alloc > && __x
            ) [inline]

```

Multimap move constructor.

Parameters

x A multimap of identical element and allocator types.

The newly-created multimap contains the exact contents of *x*. The contents of *x* are a valid, but unspecified multimap.

Definition at line 179 of file `stl_multimap.h`.

```

5.565.2.5  template<typename _Key, typename _Tp, typename _Compare =
            std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
            _Key, _Tp>>> std::multimap<_Key, _Tp, _Compare, _Alloc
            >::multimap ( initializer_list< value_type > __l, const _Compare
            & __comp = _Compare(), const allocator_type & __a =
            allocator_type() ) [inline]

```

Builds a multimap from an [initializer_list](#).

Parameters

l An [initializer_list](#).

comp A comparison functor.

5.565 std::multimap< _Key, _Tp, _Compare, _Alloc > Class Template Reference

a An allocator object.

Create a multimap consisting of copies of the elements from the [initializer_list](#). This is linear in N if the list is already sorted, and NlogN otherwise (where N is `__l.size()`).

Definition at line 192 of file `stl_multimap.h`.

```
5.565.2.6 template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp> >> template<typename _InputIterator >
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
_InputIterator __first, _InputIterator __last ) [inline]
```

Builds a multimap from a range.

Parameters

first An input iterator.

last An input iterator.

Create a multimap consisting of copies of the elements from `[first,last)`. This is linear in N if the range is already sorted, and NlogN otherwise (where N is `distance(first,last)`).

Definition at line 209 of file `stl_multimap.h`.

```
5.565.2.7 template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp> >> template<typename _InputIterator >
std::multimap< _Key, _Tp, _Compare, _Alloc >::multimap (
_InputIterator __first, _InputIterator __last, const _Compare &
__comp, const allocator_type & __a = allocator_type() )
[inline]
```

Builds a multimap from a range.

Parameters

first An input iterator.

last An input iterator.

comp A comparison functor.

a An allocator object.

Create a multimap consisting of copies of the elements from `[first,last)`. This is linear in N if the range is already sorted, and NlogN otherwise (where N is `distance(first,last)`).

Definition at line 225 of file `stl_multimap.h`.

5.565.3 Member Function Documentation

5.565.3.1 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::begin () [inline]`

Returns a read/write iterator that points to the first pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 304 of file `stl_multimap.h`.

5.565.3.2 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::begin () const [inline]`

Returns a read-only (constant) iterator that points to the first pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 313 of file `stl_multimap.h`.

5.565.3.3 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::cbegin () const [inline]`

Returns a read-only (constant) iterator that points to the first pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 377 of file `stl_multimap.h`.

5.565.3.4 `template<typename _Key, typename _Tp, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<std::pair<const _Key, _Tp>>> const_iterator std::multimap<_Key, _Tp, _Compare, _Alloc>::cend () const [inline]`

Returns a read-only (constant) iterator that points one past the last pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 386 of file `stl_multimap.h`.

5.565 std::multimap< _Key, _Tp, _Compare, _Alloc > Class Template Reference

5.565.3.5 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp>>> void std::multimap< _Key, _Tp, _Compare, _Alloc
>::clear () [inline]`

Erases all elements in a multimap. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 601 of file stl_multimap.h.

5.565.3.6 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp>>> size_type std::multimap< _Key, _Tp, _Compare,
_Alloc >::count (const key_type & __x) const [inline]`

Finds the number of elements with given key.

Parameters

x Key of (key, value) pairs to be located.

Returns

Number of elements with specified key.

Definition at line 658 of file stl_multimap.h.

5.565.3.7 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp>>> const_reverse_iterator std::multimap< _Key, _Tp,
_Compare, _Alloc >::crbegin () const [inline]`

Returns a read-only (constant) reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 395 of file stl_multimap.h.

5.565.3.8 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp>>> const_reverse_iterator std::multimap< _Key, _Tp,
_Compare, _Alloc >::crend () const [inline]`

Returns a read-only (constant) reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 404 of file stl_multimap.h.

5.565.3.9 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp>>> bool std::multimap<_Key, _Tp, _Compare, _Alloc
>::empty () const [inline]`

Returns true if the multimap is empty.

Definition at line 411 of file stl_multimap.h.

5.565.3.10 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp>>> const_iterator std::multimap<_Key, _Tp,
_Compare, _Alloc >::end () const [inline]`

Returns a read-only (constant) iterator that points one past the last pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 331 of file stl_multimap.h.

5.565.3.11 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp>>> iterator std::multimap<_Key, _Tp, _Compare,
_Alloc >::end () [inline]`

Returns a read/write iterator that points one past the last pair in the multimap. Iteration is done in ascending order according to the keys.

Definition at line 322 of file stl_multimap.h.

5.565.3.12 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp>>> std::pair<iterator, iterator> std::multimap<_Key,
_Tp, _Compare, _Alloc >::equal_range (const key_type & __x)
[inline]`

Finds a subsequence matching given key.

Parameters

x Key of (key, value) pairs to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

5.565 std::multimap< _Key, _Tp, _Compare, _Alloc > Class Template Reference

```
std::make_pair(c.lower_bound(val),  
              c.upper_bound(val))
```

(but is faster than making the calls separately).

Definition at line 725 of file stl_multimap.h.

5.565.3.13 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp> >> std::pair<const_iterator, const_iterator>
std::multimap< _Key, _Tp, _Compare, _Alloc >::equal_range (
const key_type & __x) const [inline]`

Finds a subsequence matching given key.

Parameters

x Key of (key, value) pairs to be located.

Returns

Pair of read-only (constant) iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),  
              c.upper_bound(val))
```

(but is faster than making the calls separately).

Definition at line 742 of file stl_multimap.h.

5.565.3.14 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp> >> iterator std::multimap< _Key, _Tp, _Compare,
_Alloc >::erase (iterator __position) [inline]`

Erases an element from a multimap.

Parameters

position An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from a multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 509 of file `stl_multimap.h`.

```
5.565.3.15  template<typename _Key, typename _Tp, typename _Compare =
               std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
               _Key, _Tp>>> size_type std::multimap<_Key, _Tp, _Compare,
               _Alloc>::erase ( const key_type & __x ) [inline]
```

Erases elements according to the provided key.

Parameters

x Key of element to be erased.

Returns

The number of elements erased.

This function erases all elements located by the given key from a multimap. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 539 of file `stl_multimap.h`.

```
5.565.3.16  template<typename _Key, typename _Tp, typename _Compare =
               std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
               _Key, _Tp>>> iterator std::multimap<_Key, _Tp, _Compare,
               _Alloc>::erase ( iterator __first, iterator __last ) [inline]
```

Erases a `[first,last)` range of elements from a multimap.

Parameters

first Iterator pointing to the start of the range to be erased.

last Iterator pointing to the end of the range to be erased.

Returns

The iterator *last*.

This function erases a sequence of elements from a multimap. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

5.565 std::multimap< _Key, _Tp, _Compare, _Alloc > Class Template Reference

Definition at line 558 of file stl_multimap.h.

```
5.565.3.17  template<typename _Key, typename _Tp, typename _Compare =
              std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
              _Key, _Tp> >> const_iterator std::multimap< _Key, _Tp,
              _Compare, _Alloc >::find ( const key_type & __x ) const
              [inline]
```

Tries to locate an element in a multimap.

Parameters

x Key of (key, value) pair to be located.

Returns

Read-only (constant) iterator pointing to sought-after element, or [end\(\)](#) if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns a constant iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end ([end\(\)](#)) iterator.

Definition at line 649 of file stl_multimap.h.

```
5.565.3.18  template<typename _Key, typename _Tp, typename _Compare =
              std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
              _Key, _Tp> >> iterator std::multimap< _Key, _Tp, _Compare,
              _Alloc >::find ( const key_type & __x ) [inline]
```

Tries to locate an element in a multimap.

Parameters

x Key of (key, value) pair to be located.

Returns

Iterator pointing to sought-after element, or [end\(\)](#) if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after pair. If unsuccessful it returns the past-the-end ([end\(\)](#)) iterator.

Definition at line 634 of file stl_multimap.h.

5.565.3.19 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp>>> allocator_type std::multimap< _Key, _Tp,
_Compare, _Alloc >::get_allocator () const [inline]`

Get a copy of the memory allocation object.

Definition at line 294 of file `stl_multimap.h`.

5.565.3.20 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp>>> iterator std::multimap< _Key, _Tp, _Compare,
_Alloc >::insert (const value_type & __x) [inline]`

Inserts a [std::pair](#) into the multimap.

Parameters

x Pair to be inserted (see [std::make_pair](#) for easy creation of pairs).

Returns

An iterator that points to the inserted (key,value) pair.

This function inserts a (key, value) pair into the multimap. Contrary to a [std::map](#) the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted.

Insertion requires logarithmic time.

Definition at line 438 of file `stl_multimap.h`.

5.565.3.21 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp>>> iterator std::multimap< _Key, _Tp, _Compare,
_Alloc >::insert (iterator __position, const value_type & __x)
[inline]`

Inserts a [std::pair](#) into the multimap.

Parameters

position An iterator that serves as a hint as to where the pair should be inserted.

x Pair to be inserted (see [std::make_pair](#) for easy creation of pairs).

Returns

An iterator that points to the inserted (key,value) pair.

5.565 std::multimap< _Key, _Tp, _Compare, _Alloc > Class Template Reference

This function inserts a (key, value) pair into the multimap. Contrary to a [std::map](#) the multimap does not rely on unique keys and thus multiple pairs with the same key can be inserted. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html>

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 462 of file stl_multimap.h.

```
5.565.3.22  template<typename _Key, typename _Tp, typename _Compare =  
             std::less<_Key>, typename _Alloc = std::allocator<std::pair<const  
             _Key, _Tp>>> template<typename _InputIterator > void  
             std::multimap< _Key, _Tp, _Compare, _Alloc >::insert (  
             _InputIterator __first, _InputIterator __last ) [inline]
```

A template function that attempts to insert a range of elements.

Parameters

first Iterator pointing to the start of the range to be inserted.

last Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 476 of file stl_multimap.h.

```
5.565.3.23  template<typename _Key, typename _Tp, typename _Compare =  
             std::less<_Key>, typename _Alloc = std::allocator<std::pair<const  
             _Key, _Tp>>> void std::multimap< _Key, _Tp, _Compare, _Alloc  
             >::insert ( initializer_list< value_type > __l ) [inline]
```

Attempts to insert a list of std::pairs into the multimap.

Parameters

list A std::initializer_list<value_type> of pairs to be inserted.

Complexity similar to that of the range constructor.

Definition at line 488 of file stl_multimap.h.

References std::multimap< _Key, _Tp, _Compare, _Alloc >::insert().

Referenced by std::multimap< _Key, _Tp, _Compare, _Alloc >::insert().

5.565.3.24 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp>>> key_compare std::multimap<_Key, _Tp,
_Compare, _Alloc>::key_comp () const [inline]`

Returns the key comparison object out of which the multimap was constructed.

Definition at line 610 of file `stl_multimap.h`.

5.565.3.25 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp>>> const_iterator std::multimap<_Key, _Tp,
_Compare, _Alloc>::lower_bound (const key_type & __x) const
[inline]`

Finds the beginning of a subsequence matching given key.

Parameters

x Key of (key, value) pair to be located.

Returns

Read-only (constant) iterator pointing to first element equal to or greater than key, or `end()`.

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful the iterator will point to the next greatest element or, if no such greater element exists, to `end()`.

Definition at line 688 of file `stl_multimap.h`.

5.565.3.26 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp>>> iterator std::multimap<_Key, _Tp, _Compare,
_Alloc>::lower_bound (const key_type & __x) [inline]`

Finds the beginning of a subsequence matching given key.

Parameters

x Key of (key, value) pair to be located.

Returns

Iterator pointing to first element equal to or greater than key, or `end()`.

5.565 std::multimap< _Key, _Tp, _Compare, _Alloc > Class Template Reference

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or [end\(\)](#) if no such element exists.

Definition at line 673 of file stl_multimap.h.

```
5.565.3.27  template<typename _Key, typename _Tp, typename _Compare =
              std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
              _Key, _Tp>>> size_type std::multimap< _Key, _Tp, _Compare,
              _Alloc >::max_size ( ) const  [inline]
```

Returns the maximum size of the multimap.

Definition at line 421 of file stl_multimap.h.

```
5.565.3.28  template<typename _Key, typename _Tp, typename _Compare =
              std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
              _Key, _Tp>>> multimap& std::multimap< _Key, _Tp, _Compare,
              _Alloc >::operator= ( multimap< _Key, _Tp, _Compare, _Alloc >
              && __x ) [inline]
```

Multimap move assignment operator.

Parameters

x A multimap of identical element and allocator types.

The contents of *x* are moved into this multimap (without copying). *x* is a valid, but unspecified multimap.

Definition at line 263 of file stl_multimap.h.

```
5.565.3.29  template<typename _Key, typename _Tp, typename _Compare =
              std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
              _Key, _Tp>>> multimap& std::multimap< _Key, _Tp, _Compare,
              _Alloc >::operator= ( const multimap< _Key, _Tp, _Compare,
              _Alloc > & __x ) [inline]
```

Multimap assignment operator.

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Parameters

x A multimap of identical element and allocator types.

All the elements of *x* are copied, but unlike the copy constructor, the allocator object is not copied.

Definition at line 248 of file `stl_multimap.h`.

```
5.565.3.30  template<typename _Key, typename _Tp, typename _Compare =
              std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
              _Key, _Tp> >>> multimap& std::multimap<_Key, _Tp, _Compare,
              _Alloc >::operator= ( initializer_list< value_type > __l )
              [inline]
```

Multimap list assignment operator.

Parameters

l An [initializer_list](#).

This function fills a multimap with copies of the elements in the initializer list *l*.

Note that the assignment completely changes the multimap and that the resulting multimap's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 284 of file `stl_multimap.h`.

```
5.565.3.31  template<typename _Key, typename _Tp, typename _Compare =
              std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
              _Key, _Tp> >>> reverse_iterator std::multimap<_Key, _Tp,
              _Compare, _Alloc >::rbegin ( ) [inline]
```

Returns a read/write reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 340 of file `stl_multimap.h`.

```
5.565.3.32  template<typename _Key, typename _Tp, typename _Compare =
              std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
              _Key, _Tp> >>> const_reverse_iterator std::multimap<_Key, _Tp,
              _Compare, _Alloc >::rbegin ( ) const [inline]
```

Returns a read-only (constant) reverse iterator that points to the last pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 349 of file `stl_multimap.h`.

5.565 std::multimap< _Key, _Tp, _Compare, _Alloc > Class Template Reference

5.565.3.33 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp>>> reverse_iterator std::multimap< _Key, _Tp,
_Compare, _Alloc >::rend () [inline]`

Returns a read/write reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 358 of file stl_multimap.h.

5.565.3.34 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp>>> const_reverse_iterator std::multimap< _Key, _Tp,
_Compare, _Alloc >::rend () const [inline]`

Returns a read-only (constant) reverse iterator that points to one before the first pair in the multimap. Iteration is done in descending order according to the keys.

Definition at line 367 of file stl_multimap.h.

5.565.3.35 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp>>> size_type std::multimap< _Key, _Tp, _Compare,
_Alloc >::size () const [inline]`

Returns the size of the multimap.

Definition at line 416 of file stl_multimap.h.

5.565.3.36 `template<typename _Key, typename _Tp, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
_Key, _Tp>>> void std::multimap< _Key, _Tp, _Compare, _Alloc
>::swap (multimap< _Key, _Tp, _Compare, _Alloc > & __x)
[inline]`

Swaps data with another multimap.

Parameters

x A multimap of the same element and allocator types.

This exchanges the elements between two multimaps in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(m1,m2)` will feed to this function.

Definition at line 591 of file stl_multimap.h.

Referenced by std::swap().

```
5.565.3.37  template<typename _Key, typename _Tp, typename _Compare =
              std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
              _Key, _Tp>>> const_iterator std::multimap< _Key, _Tp,
              _Compare, _Alloc >::upper_bound ( const key_type & __x ) const
              [inline]
```

Finds the end of a subsequence matching given key.

Parameters

x Key of (key, value) pair to be located.

Returns

Read-only (constant) iterator pointing to first iterator greater than key, or [end\(\)](#).

Definition at line 708 of file stl_multimap.h.

```
5.565.3.38  template<typename _Key, typename _Tp, typename _Compare =
              std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
              _Key, _Tp>>> iterator std::multimap< _Key, _Tp, _Compare,
              _Alloc >::upper_bound ( const key_type & __x ) [inline]
```

Finds the end of a subsequence matching given key.

Parameters

x Key of (key, value) pair to be located.

Returns

Iterator pointing to the first element greater than key, or [end\(\)](#).

Definition at line 698 of file stl_multimap.h.

```
5.565.3.39  template<typename _Key, typename _Tp, typename _Compare =
              std::less<_Key>, typename _Alloc = std::allocator<std::pair<const
              _Key, _Tp>>> value_compare std::multimap< _Key, _Tp,
              _Compare, _Alloc >::value_comp ( ) const [inline]
```

Returns a value comparison object, built from the key comparison object out of which the multimap was constructed.

Definition at line 618 of file stl_multimap.h.

5.567.1 Detailed Description

template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> class std::multiset<_Key, _Compare, _Alloc >

A standard container made up of elements, which can be retrieved in logarithmic time. Meets the requirements of a [container](#), a [reversible container](#), and an

associative container (using equivalent keys). For a `multiset<Key>` the `key_type` and `value_type` are `Key`.

Multisets support bidirectional iterators.

The private tree data is declared exactly the same way for set and multiset; the distinction is made entirely in how the tree functions are called (`*_unique` versus `*_equal`, same as the standard).

Definition at line 84 of file `stl_multiset.h`.

5.567.2 Constructor & Destructor Documentation

5.567.2.1 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> std::multiset< _Key,
_Compare, _Alloc >::multiset () [inline]`

Default constructor creates no elements.

Definition at line 129 of file `stl_multiset.h`.

5.567.2.2 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> std::multiset< _Key,
_Compare, _Alloc >::multiset (const _Compare & __comp, const
allocator_type & __a = allocator_type()) [inline,
explicit]`

Creates a multiset with no elements.

Parameters

comp Comparator to use.

a An allocator object.

Definition at line 138 of file `stl_multiset.h`.

5.567.2.3 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> template<typename
_InputIterator > std::multiset< _Key, _Compare, _Alloc >::multiset
(_InputIterator __first, _InputIterator __last) [inline]`

Builds a multiset from a range.

Parameters

first An input iterator.

last An input iterator.

Create a multiset consisting of copies of the elements from [first,last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(first,last)).

Definition at line 152 of file stl_multiset.h.

```
5.567.2.4 template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> template<typename
_InputIterator > std::multiset< _Key, _Compare, _Alloc >::multiset
( _InputIterator __first, _InputIterator __last, const _Compare &
__comp, const allocator_type & __a = allocator_type() )
[inline]
```

Builds a multiset from a range.

Parameters

first An input iterator.

last An input iterator.

comp A comparison functor.

a An allocator object.

Create a multiset consisting of copies of the elements from [first,last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(first,last)).

Definition at line 168 of file stl_multiset.h.

```
5.567.2.5 template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> std::multiset< _Key,
_Compare, _Alloc >::multiset ( const multiset< _Key, _Compare,
_Alloc > & __x ) [inline]
```

Multiset copy constructor.

Parameters

x A multiset of identical element and allocator types.

The newly-created multiset uses a copy of the allocation object used by *x*.

Definition at line 181 of file stl_multiset.h.

5.567.2.6 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> std::multiset< _Key,
_Compare, _Alloc >::multiset (multiset< _Key, _Compare, _Alloc >
&& __x) [inline]`

Multiset move constructor.

Parameters

x A multiset of identical element and allocator types.

The newly-created multiset contains the exact contents of *x*. The contents of *x* are a valid, but unspecified multiset.

Definition at line 192 of file stl_multiset.h.

5.567.2.7 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> std::multiset< _Key,
_Compare, _Alloc >::multiset (initializer_list< value_type > __l,
const _Compare & __comp = _Compare(), const allocator_type &
__a = allocator_type()) [inline]`

Builds a multiset from an [initializer_list](#).

Parameters

l An [initializer_list](#).

comp A comparison functor.

a An allocator object.

Create a multiset consisting of copies of the elements from the list. This is linear in N if the list is already sorted, and NlogN otherwise (where N is *l.size()*).

Definition at line 205 of file stl_multiset.h.

5.567.3 Member Function Documentation

5.567.3.1 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> iterator std::multiset<
_Key, _Compare, _Alloc >::begin () const [inline]`

Returns a read-only (constant) iterator that points to the first element in the multiset. Iteration is done in ascending order according to the keys.

Definition at line 285 of file stl_multiset.h.

5.567.3.2 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> iterator std::multiset<
_Key, _Compare, _Alloc >::cbegin () const [inline]`

Returns a read-only (constant) iterator that points to the first element in the multiset. Iteration is done in ascending order according to the keys.

Definition at line 322 of file stl_multiset.h.

5.567.3.3 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> iterator std::multiset<
_Key, _Compare, _Alloc >::cend () const [inline]`

Returns a read-only (constant) iterator that points one past the last element in the multiset. Iteration is done in ascending order according to the keys.

Definition at line 331 of file stl_multiset.h.

5.567.3.4 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> void std::multiset< _Key,
_Compare, _Alloc >::clear () [inline]`

Erases all elements in a multiset. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 541 of file stl_multiset.h.

5.567.3.5 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> size_type std::multiset<
_Key, _Compare, _Alloc >::count (const key_type & __x) const
[inline]`

Finds the number of elements with given key.

Parameters

x Key of elements to be located.

Returns

Number of elements with specified key.

Definition at line 552 of file stl_multiset.h.

5.567.3.6 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> reverse_iterator
std::multiset< _Key, _Compare, _Alloc >::crbegin () const
[inline]`

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

Definition at line 340 of file stl_multiset.h.

5.567.3.7 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> reverse_iterator
std::multiset< _Key, _Compare, _Alloc >::crend () const
[inline]`

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

Definition at line 349 of file stl_multiset.h.

5.567.3.8 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> bool std::multiset< _Key,
_Compare, _Alloc >::empty () const [inline]`

Returns true if the set is empty.

Definition at line 355 of file stl_multiset.h.

5.567.3.9 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> iterator std::multiset<
_Key, _Compare, _Alloc >::end () const [inline]`

Returns a read-only (constant) iterator that points one past the last element in the multiset. Iteration is done in ascending order according to the keys.

Definition at line 294 of file stl_multiset.h.

5.567.3.10 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> std::pair<iterator,
iterator> std::multiset< _Key, _Compare, _Alloc >::equal_range (
const key_type & __x) [inline]`

Finds a subsequence matching given key.

Parameters

x Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

Definition at line 632 of file stl_multiset.h.

```
5.567.3.11  template<typename _Key, typename _Compare = std::less<_Key>,
                typename _Alloc = std::allocator<_Key>>> std::pair<const_iterator,
                const_iterator> std::multiset<_Key, _Compare, _Alloc
                >::equal_range( const key_type & __x ) const  [inline]
```

Finds a subsequence matching given key.

Parameters

x Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

Definition at line 636 of file stl_multiset.h.

```
5.567.3.12  template<typename _Key, typename _Compare = std::less<_Key>,
                typename _Alloc = std::allocator<_Key>>> iterator std::multiset<
                _Key, _Compare, _Alloc >::erase( iterator __position )
                [inline]
```

Erases an element from a multiset.

Parameters

position An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, `end()` is returned.

This function erases an element, pointed to by the given iterator, from a multiset. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 466 of file `stl_multiset.h`.

```
5.567.3.13 template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> size_type std::multiset<
_Key, _Compare, _Alloc >::erase ( const key_type & __x )
[inline]
```

Erases elements according to the provided key.

Parameters

x Key of element to be erased.

Returns

The number of elements erased.

This function erases all elements located by the given key from a multiset. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 496 of file `stl_multiset.h`.

```
5.567.3.14 template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> iterator std::multiset<
_Key, _Compare, _Alloc >::erase ( iterator __first, iterator __last
) [inline]
```

Erases a `[first,last)` range of elements from a multiset.

Parameters

first Iterator pointing to the start of the range to be erased.

last Iterator pointing to the end of the range to be erased.

Returns

The iterator *last*.

This function erases a sequence of elements from a multiset. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 515 of file `stl_multiset.h`.

```
5.567.3.15  template<typename _Key, typename _Compare = std::less<_Key>,
              typename _Alloc = std::allocator<_Key>> iterator std::multiset<
              _Key, _Compare, _Alloc >::find ( const key_type & __x )
              [inline]
```

Tries to locate an element in a set.

Parameters

x Element to be located.

Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 570 of file `stl_multiset.h`.

```
5.567.3.16  template<typename _Key, typename _Compare = std::less<_Key>,
              typename _Alloc = std::allocator<_Key>> const_iterator
              std::multiset< _Key, _Compare, _Alloc >::find ( const key_type &
              __x )const [inline]
```

Tries to locate an element in a set.

Parameters

x Element to be located.

Returns

Iterator pointing to sought-after element, or `end()` if not found.

5.567 std::multiset< _Key, _Compare, _Alloc > Class Template Reference 2779

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 574 of file `stl_multiset.h`.

```
5.567.3.17 template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> allocator_type
std::multiset< _Key, _Compare, _Alloc >::get_allocator ( ) const
[inline]
```

Returns the memory allocation object.

Definition at line 276 of file `stl_multiset.h`.

```
5.567.3.18 template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> iterator std::multiset<
_Key, _Compare, _Alloc >::insert ( const value_type & __x )
[inline]
```

Inserts an element into the multiset.

Parameters

x Element to be inserted.

Returns

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a `std::set` the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Insertion requires logarithmic time.

Definition at line 396 of file `stl_multiset.h`.

```
5.567.3.19 template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> iterator std::multiset<
_Key, _Compare, _Alloc >::insert ( iterator __position, const
value_type & __x ) [inline]
```

Inserts an element into the multiset.

Parameters

position An iterator that serves as a hint as to where the element should be inserted.

x Element to be inserted.

Returns

An iterator that points to the inserted element.

This function inserts an element into the multiset. Contrary to a [std::set](#) the multiset does not rely on unique keys and thus multiple copies of the same element can be inserted.

Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

See <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17.html> for more on *hinting*.

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 420 of file `stl_multiset.h`.

```
5.567.3.20  template<typename _Key, typename _Compare = std::less<_Key>,
              typename _Alloc = std::allocator<_Key>>> template<typename
              _InputIterator > void std::multiset< _Key, _Compare, _Alloc
              >::insert ( _InputIterator __first, _InputIterator __last )
              [inline]
```

A template function that tries to insert a range of elements.

Parameters

first Iterator pointing to the start of the range to be inserted.

last Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 433 of file `stl_multiset.h`.

```
5.567.3.21  template<typename _Key, typename _Compare = std::less<_Key>,
              typename _Alloc = std::allocator<_Key>>> void std::multiset<
              _Key, _Compare, _Alloc >::insert ( initializer_list< value_type >
              __l ) [inline]
```

Attempts to insert a list of elements into the multiset.

Parameters

list A `std::initializer_list<value_type>` of elements to be inserted.

5.567 std::multiset< _Key, _Compare, _Alloc > Class Template Reference 2781

Complexity similar to that of the range constructor.

Definition at line 445 of file stl_multiset.h.

References std::multiset< _Key, _Compare, _Alloc >::insert().

Referenced by std::multiset< _Key, _Compare, _Alloc >::insert().

5.567.3.22 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> key_compare
std::multiset< _Key, _Compare, _Alloc >::key_comp () const
[inline]`

Returns the comparison object.

Definition at line 268 of file stl_multiset.h.

5.567.3.23 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> iterator std::multiset<
_Key, _Compare, _Alloc >::lower_bound (const key_type & __x)
[inline]`

Finds the beginning of a subsequence matching given key.

Parameters

x Key to be located.

Returns

Iterator pointing to first element equal to or greater than key, or [end\(\)](#).

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or [end\(\)](#) if no such element exists.

Definition at line 591 of file stl_multiset.h.

5.567.3.24 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> const_iterator
std::multiset< _Key, _Compare, _Alloc >::lower_bound (const
key_type & __x) const [inline]`

Finds the beginning of a subsequence matching given key.

Parameters

x Key to be located.

Returns

Iterator pointing to first element equal to or greater than key, or [end\(\)](#).

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or [end\(\)](#) if no such element exists.

Definition at line 595 of file `stl_multiset.h`.

5.567.3.25 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> size_type std::multiset<
_Key, _Compare, _Alloc >::max_size () const [inline]`

Returns the maximum size of the set.

Definition at line 365 of file `stl_multiset.h`.

5.567.3.26 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> multiset&
std::multiset< _Key, _Compare, _Alloc >::operator= (multiset<
_Key, _Compare, _Alloc > && __x) [inline]`

Multiset move assignment operator.

Parameters

x A multiset of identical element and allocator types.

The contents of *x* are moved into this multiset (without copying). *x* is a valid, but unspecified multiset.

Definition at line 235 of file `stl_multiset.h`.

5.567.3.27 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> multiset&
std::multiset< _Key, _Compare, _Alloc >::operator= (
initializer_list< value_type > __l) [inline]`

Multiset list assignment operator.

Parameters

l An [initializer_list](#).

This function fills a multiset with copies of the elements in the initializer list *l*.

5.567 std::multiset< _Key, _Compare, _Alloc > Class Template Reference 2783

Note that the assignment completely changes the multiset and that the resulting multiset's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 256 of file stl_multiset.h.

```
5.567.3.28 template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> multiset&
std::multiset< _Key, _Compare, _Alloc >::operator= ( const
multiset< _Key, _Compare, _Alloc > & __x ) [inline]
```

Multiset assignment operator.

Parameters

x A multiset of identical element and allocator types.

All the elements of *x* are copied, but unlike the copy constructor, the allocator object is not copied.

Definition at line 220 of file stl_multiset.h.

```
5.567.3.29 template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> reverse_iterator
std::multiset< _Key, _Compare, _Alloc >::rbegin ( ) const
[inline]
```

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

Definition at line 303 of file stl_multiset.h.

```
5.567.3.30 template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> reverse_iterator
std::multiset< _Key, _Compare, _Alloc >::rend ( ) const
[inline]
```

Returns a read-only (constant) reverse iterator that points to the last element in the multiset. Iteration is done in descending order according to the keys.

Definition at line 312 of file stl_multiset.h.

```
5.567.3.31 template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> size_type std::multiset<
_Key, _Compare, _Alloc >::size ( ) const [inline]
```

Returns the size of the set.

Definition at line 360 of file stl_multiset.h.

```
5.567.3.32  template<typename _Key, typename _Compare = std::less<_Key>,
               typename _Alloc = std::allocator<_Key>> void std::multiset<
               _Key, _Compare, _Alloc >::swap ( multiset< _Key, _Compare,
               _Alloc > & __x ) [inline]
```

Swaps data with another multiset.

Parameters

x A multiset of the same element and allocator types.

This exchanges the elements between two multisets in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global `std::swap()` function is specialized such that `std::swap(s1,s2)` will feed to this function.

Definition at line 380 of file stl_multiset.h.

Referenced by `std::swap()`.

```
5.567.3.33  template<typename _Key, typename _Compare = std::less<_Key>,
               typename _Alloc = std::allocator<_Key>> iterator std::multiset<
               _Key, _Compare, _Alloc >::upper_bound ( const key_type & __x )
               [inline]
```

Finds the end of a subsequence matching given key.

Parameters

x Key to be located.

Returns

Iterator pointing to the first element greater than key, or `end()`.

Definition at line 607 of file stl_multiset.h.

```
5.567.3.34  template<typename _Key, typename _Compare = std::less<_Key>,
               typename _Alloc = std::allocator<_Key>> const_iterator
               std::multiset< _Key, _Compare, _Alloc >::upper_bound ( const
               key_type & __x ) const [inline]
```

Finds the end of a subsequence matching given key.

Parameters

x Key to be located.

Returns

Iterator pointing to the first element greater than key, or [end\(\)](#).

Definition at line 611 of file stl_multiset.h.

```
5.567.3.35 template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> value_compare
std::multiset< _Key, _Compare, _Alloc >::value_comp ( ) const
[inline]
```

Returns the comparison object.

Definition at line 272 of file stl_multiset.h.

5.567.4 Friends And Related Function Documentation

```
5.567.4.1 template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> template<typename _K1
, typename _C1, typename _A1 > bool operator< ( const multiset<
_K1, _C1, _A1 > &, const multiset< _K1, _C1, _A1 > & )
[friend]
```

Finds a subsequence matching given key.

Parameters

x Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

5.567.4.2 `template<typename _Key, typename _Compare = std::less<_Key>,
 typename _Alloc = std::allocator<_Key>> template<typename
 _K1, typename _C1, typename _A1 > bool operator==(const
 multiset< _K1, _C1, _A1 > &, const multiset< _K1, _C1, _A1 > &
) [friend]`

Finds a subsequence matching given key.

Parameters

x Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),  
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

5.570.1 Detailed Description

`template<typename _IntType = int> class std::negative_binomial_distribution<_IntType>`

A `negative_binomial_distribution` random number distribution. The formula for the negative binomial probability mass function is $p(i) = \binom{n}{i} p^i (1-p)^{t-i}$ where t and p are the parameters of the distribution.

Definition at line 3795 of file random.h.

5.570.2 Member Typedef Documentation

5.570.2.1 `template<typename _IntType = int> typedef _IntType
std::negative_binomial_distribution< _IntType >::result_type`

The type of the range of the distribution.

Definition at line 3802 of file random.h.

5.570.3 Member Function Documentation

5.570.3.1 `template<typename _IntType = int> _IntType
std::negative_binomial_distribution< _IntType >::k () const
[inline]`

Return the k parameter of the distribution.

Definition at line 3851 of file random.h.

5.570.3.2 `template<typename _IntType = int> result_type
std::negative_binomial_distribution< _IntType >::max () const
[inline]`

Returns the least upper bound value of the distribution.

Definition at line 3887 of file random.h.

5.570.3.3 `template<typename _IntType = int> result_type
std::negative_binomial_distribution< _IntType >::min () const
[inline]`

Returns the greatest lower bound value of the distribution.

Definition at line 3880 of file random.h.

5.570.3.4 `template<typename _IntType > template<typename
UniformRandomNumberGenerator > negative
binomial_distribution< _IntType >::result_type
std::negative_binomial_distribution< _IntType >::operator() (
_UniformRandomNumberGenerator & __urng)`

Generating functions.

Definition at line 1078 of file random.tcc.

5.570.3.5 `template<typename _IntType = int> double
std::negative_binomial_distribution< _IntType >::p () const
[inline]`

Return the p parameter of the distribution.

Definition at line 3858 of file random.h.

5.570.3.6 `template<typename _IntType = int> param_type
std::negative_binomial_distribution< _IntType >::param () const
[inline]`

Returns the parameter set of the distribution.

Definition at line 3865 of file random.h.

5.570.3.7 `template<typename _IntType = int> void std::negative_binomial_
distribution< _IntType >::param (const param_type & __param)
[inline]`

Sets the parameter set of the distribution.

Parameters

__param The new parameter set of the distribution.

Definition at line 3873 of file random.h.

5.570.3.8 `template<typename _IntType = int> void
std::negative_binomial_distribution< _IntType >::reset ()
[inline]`

Resets the distribution state.

Definition at line 3844 of file random.h.

References std::gamma_distribution< _RealType >::reset().

5.570.4 Friends And Related Function Documentation

5.570.4.1 `template<typename _IntType = int> template<typename _IntType1 ,
typename _CharT , typename _Traits > std::basic_ostream<_CharT,
_Traits>& operator<< (std::basic_ostream< _CharT, _Traits > &
, const std::negative_binomial_distribution< _IntType1 > &)
[friend]`

Inserts a `negative_binomial_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

`__os` An output stream.

`__x` A `negative_binomial_distribution` random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

5.570.4.2 `template<typename _IntType = int> template<typename _IntType1
> bool operator==(const std::negative_binomial_distribution<
_IntType1 > & __d1, const std::negative_binomial_distribution<
_IntType1 > & __d2) [friend]`

Return true if two negative binomial distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 3909 of file `random.h`.

5.570.4.3 `template<typename _IntType = int> template<typename _IntType1 ,
typename _CharT , typename _Traits > std::basic_istream<_CharT,
_Traits>& operator>> (std::basic_istream< _CharT, _Traits > & ,
std::negative_binomial_distribution< _IntType1 > &) [friend]`

Extracts a `negative_binomial_distribution` random number distribution `__x` from the input stream `__is`.

Parameters

`__is` An input stream.

`__x` A `negative_binomial_distribution` random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

5.573.1 Detailed Description

template<typename _RealType = double> class std::normal_distribution< _RealType >

A normal continuous distribution for random numbers. The formula for the normal probability density function is

$$p(x|\mu, \sigma) = \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{x-\mu}{2\sigma^2}}$$

Definition at line 1993 of file random.h.

5.573.2 Member Typedef Documentation

5.573.2.1 `template<typename _RealType = double> typedef _RealType std::normal_distribution< _RealType >::result_type`

The type of the range of the distribution.

Definition at line 2000 of file random.h.

5.573.3 Constructor & Destructor Documentation

5.573.3.1 `template<typename _RealType = double> std::normal_distribution< _RealType >::normal_distribution (result_type __mean = result_type (0), result_type __stddev = result_type (1)) [inline, explicit]`

Constructs a normal distribution with parameters *mean* and standard deviation.

Definition at line 2038 of file random.h.

5.573.4 Member Function Documentation

5.573.4.1 `template<typename _RealType = double> result_type std::normal_distribution< _RealType >::max () const [inline]`

Returns the least upper bound value of the distribution.

Definition at line 2095 of file random.h.

Referenced by `std::normal_distribution< result_type >::max()`.

5.573.4.2 `template<typename _RealType = double> _RealType std::normal_distribution< _RealType >::mean () const [inline]`

Returns the mean of the distribution.

Definition at line 2059 of file random.h.

5.573.4.3 `template<typename _RealType = double> result_type
std::normal_distribution< _RealType >::min () const [inline]`

Returns the greatest lower bound value of the distribution.

Definition at line 2088 of file random.h.

Referenced by std::normal_distribution< result_type >::min().

5.573.4.4 `template<typename _RealType = double> template<typename
_UniformRandomNumberGenerator > result_type
std::normal_distribution< _RealType >::operator() (
_UniformRandomNumberGenerator & __urng) [inline]`

Generating functions.

Definition at line 2103 of file random.h.

Referenced by std::normal_distribution< result_type >::operator()().

5.573.4.5 `template<typename _RealType > template<typename
_UniformRandomNumberGenerator > normal_distribution<
_RealType >::result_type std::normal_distribution< _RealType
>::operator() (_UniformRandomNumberGenerator & __urng,
const param_type & __param)`

Polar method due to Marsaglia.

Devroye, L. Non-Uniform Random Variates Generation. Springer-Verlag, New York, 1986, Ch. V, Sect. 4.4.

Definition at line 1644 of file random.tcc.

References std::log(), and std::sqrt().

5.573.4.6 `template<typename _RealType = double> void
std::normal_distribution< _RealType >::param (const param_type
& __param) [inline]`

Sets the parameter set of the distribution.

Parameters

`__param` The new parameter set of the distribution.

Definition at line 2081 of file random.h.

5.573.4.7 `template<typename _RealType = double> param_type
std::normal_distribution< _RealType >::param () const
[inline]`

Returns the parameter set of the distribution.

Definition at line 2073 of file random.h.

Referenced by `std::normal_distribution< result_type >::operator()()`.

5.573.4.8 `template<typename _RealType = double> void
std::normal_distribution< _RealType >::reset () [inline]`

Resets the distribution state.

Definition at line 2052 of file random.h.

Referenced by `std::poisson_distribution< _IntType >::reset()`, `std::binomial_distribution< _IntType >::reset()`, `std::student_t_distribution< _RealType >::reset()`, `std::gamma_distribution< result_type >::reset()`, and `std::lognormal_distribution< _RealType >::reset()`.

5.573.4.9 `template<typename _RealType = double> _RealType
std::normal_distribution< _RealType >::stddev () const
[inline]`

Returns the standard deviation of the distribution.

Definition at line 2066 of file random.h.

5.573.5 Friends And Related Function Documentation

5.573.5.1 `template<typename _RealType = double> template<typename
_RealType1 , typename _CharT , typename _Traits >
std::basic_ostream< _CharT, _Traits>& operator<<
(std::basic_ostream< _CharT, _Traits > & , const
std::normal_distribution< _RealType1 > &) [friend]`

Inserts a `normal_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

`__os` An output stream.

`__x` A `normal_distribution` random number distribution.

5.574 `std::normal_distribution<_RealType>::param_type` Struct Reference 2799

Returns

The output stream with the state of `__x` inserted or in an error state.

5.573.5.2 `template<typename _RealType = double> template<typename
_RealType1 > bool operator==(const std::normal_distribution<
_RealType1 > & __d1, const std::normal_distribution<_RealType1
> & __d2) [friend]`

Return true if two normal distributions have the same parameters and the sequences that would be generated are equal.

5.573.5.3 `template<typename _RealType = double> template<typename
_RealType1 , typename _CharT , typename _Traits >
std::basic_istream<_CharT, _Traits>& operator>>
(std::basic_istream<_CharT, _Traits> & ,
std::normal_distribution<_RealType1> &) [friend]`

Extracts a normal_distribution random number distribution `__x` from the input stream `__is`.

Parameters

`__is` An input stream.

`__x` A normal_distribution random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

5.576.1 Detailed Description

template<typename _CharT, typename _InIter> class std::num_get< _CharT, _InIter >

Primary class template [num_get](#).

This facet encapsulates the code to parse and return a number from a string. It is used by the istream numeric extraction operators. The [num_get](#) template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the [num_get](#) facet.

Definition at line 1911 of file [locale_facets.h](#).

5.576.2 Member Typedef Documentation

5.576.2.1 **template<typename _CharT, typename _InIter> typedef _CharT std::num_get< _CharT, _InIter >::char_type**

Public typedefs.

Definition at line 1917 of file [locale_facets.h](#).

5.576.2.2 `template<typename _CharT, typename _InIter > typedef _InIter
std::num_get< _CharT, _InIter >::iter_type`

Public typedefs.

Definition at line 1918 of file locale_facets.h.

5.576.3 Constructor & Destructor Documentation

5.576.3.1 `template<typename _CharT, typename _InIter > std::num_get<
_CharT, _InIter >::num_get (size_t __refs = 0) [inline,
explicit]`

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

refs Passed to the base facet class.

Definition at line 1932 of file locale_facets.h.

5.576.3.2 `template<typename _CharT, typename _InIter > virtual
std::num_get< _CharT, _InIter >::~~num_get () [inline,
protected, virtual]`

Destructor.

Definition at line 2101 of file locale_facets.h.

5.576.4 Member Function Documentation

5.576.4.1 `template<typename _CharT, typename _InIter > _InIter
std::num_get< _CharT, _InIter >::do_get (iter_type __beg,
iter_type __end, ios_base & __io, ios_base::iostate & __err, float &
__v) const [protected, virtual]`

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

[get\(\)](#) for more details.

Parameters

in Start of input stream.
end End of input stream.
io Source of locale and flags.
err Error flags to set.
v Value to format and insert.

Returns

Iterator after reading.

Definition at line 686 of file locale_facets.tcc.

References std::basic_string< _CharT, _Traits, _Alloc >::c_str(), std::ios_base::eofbit, and std::basic_string< _CharT, _Traits, _Alloc >::reserve().

5.576.4.2 `template<typename _CharT, typename _InIter > _InIter
std::num_get< _CharT, _InIter >::do_get (iter_type __beg,
iter_type __end, ios_base & __io, ios_base::iostate & __err, bool &
__v) const [protected, virtual]`

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

[get\(\)](#) for more details.

Parameters

in Start of input stream.
end End of input stream.
io Source of locale and flags.
err Error flags to set.
v Value to format and insert.

Returns

Iterator after reading.

Definition at line 590 of file locale_facets.tcc.

References std::ios_base::M_getloc(), std::ios_base::boolalpha, std::ios_base::eofbit, std::ios_base::failbit, std::ios_base::flags(), and std::ios_base::goodbit.

Referenced by std::num_get< _CharT, _InIter >::get().

5.576.4.3 `template<typename _CharT, typename _InIter > virtual iter_type
std::num_get< _CharT, _InIter >::do_get (iter_type __beg,
iter_type __end, ios_base & __io, ios_base::iostate & __err, long &
__v) const [inline, protected, virtual]`

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

[get\(\)](#) for more details.

Parameters

in Start of input stream.
end End of input stream.
io Source of locale and flags.
err Error flags to set.
v Value to format and insert.

Returns

Iterator after reading.

Definition at line 2169 of file locale_facets.h.

5.576.4.4 `template<typename _CharT, typename _InIter > virtual iter_type
std::num_get< _CharT, _InIter >::do_get (iter_type __beg,
iter_type __end, ios_base & __io, ios_base::iostate & __err,
unsigned short & __v) const [inline, protected,
virtual]`

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

[get\(\)](#) for more details.

Parameters

in Start of input stream.
end End of input stream.

io Source of locale and flags.

err Error flags to set.

v Value to format and insert.

Returns

Iterator after reading.

Definition at line 2174 of file locale_facets.h.

```
5.576.4.5 template<typename _CharT , typename _InIter > virtual iter_type  
std::num_get< _CharT, _InIter >::do_get ( iter_type __beg,  
iter_type __end, ios_base & __io, ios_base::iostate & __err,  
unsigned int & __v ) const [inline, protected, virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

[get\(\)](#) for more details.

Parameters

in Start of input stream.

end End of input stream.

io Source of locale and flags.

err Error flags to set.

v Value to format and insert.

Returns

Iterator after reading.

Definition at line 2179 of file locale_facets.h.

```
5.576.4.6 template<typename _CharT , typename _InIter > virtual iter_type  
std::num_get< _CharT, _InIter >::do_get ( iter_type __beg,

unsigned long & __v ) const [inline, protected, virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

[get\(\)](#) for more details.

Parameters

in Start of input stream.
end End of input stream.
io Source of locale and flags.
err Error flags to set.
v Value to format and insert.

Returns

Iterator after reading.

Definition at line 2184 of file locale_facets.h.

```
5.576.4.7 template<typename _CharT, typename _InIter > virtual iter_type  
std::num_get< _CharT, _InIter >::do_get ( iter_type __beg,  
iter_type __end, ios_base & __io, ios_base::iostate & __err, long  
long & __v ) const [inline, protected, virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

[get\(\)](#) for more details.

Parameters

in Start of input stream.
end End of input stream.
io Source of locale and flags.
err Error flags to set.
v Value to format and insert.

Returns

Iterator after reading.

Definition at line 2190 of file locale_facets.h.

```
5.576.4.8 template<typename _CharT , typename _InIter > virtual iter_type  
std::num_get< _CharT, _InIter >::do_get ( iter_type __beg,

iter_type __end, ios_base & __io, ios_base::iostate & __err, void
*& __v ) const [protected, virtual]
```

Numeric parsing.

Parses the input stream into the variable *v*. This function is a hook for derived classes to change the value returned.

See also

[get\(\)](#) for more details.

Parameters

in Start of input stream.

end End of input stream.

io Source of locale and flags.

err Error flags to set.

v Value to format and insert.

Returns

Iterator after reading.

Definition at line 748 of file locale_facets.tcc.

References `std::ios_base::basefield`, `std::ios_base::flags()`, and `std::ios_base::hex`.

```
5.576.4.12 template<typename _CharT, typename _InIter > iter_type
std::num_get< _CharT, _InIter >::get ( iter_type __in, iter_type
__end, ios_base & __io, ios_base::iostate & __err, long & __v )
const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling [num_get::do_get\(\)](#).

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of `io.flags()` & [ios_base::basefield](#). If equal to [ios_base::oct](#), parses like the `scanf` `o` specifier. Else if equal to [ios_base::hex](#), parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used.

Digit grouping is interpreted according to [numpunct::grouping\(\)](#) and [numpunct::thousands_sep\(\)](#). If the pattern of digit groups isn't consistent, sets err to [ios_base::failbit](#).

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to [ios_base::failbit](#) and leaves *v* unaltered. Sets err to [ios_base::eofbit](#) if the stream is emptied.

Parameters

in Start of input stream.
end End of input stream.
io Source of locale and flags.
err Error flags to set.
v Value to format and insert.

Returns

Iterator after reading.

Definition at line 1994 of file locale_facets.h.

References [std::num_get<_CharT, _InIter >::do_get\(\)](#).

```
5.576.4.13 template<typename _CharT , typename _InIter > iter_type
std::num_get<_CharT, _InIter >::get ( iter_type __in, iter_type
__end, ios_base & __io, ios_base::iostate & __err, double & __v )
const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling [num_get::do_get\(\)](#).

The input characters are parsed like the scanf *g* specifier. The matching type length modifier is also used.

The decimal point character used is [numpunct::decimal_point\(\)](#). Digit grouping is interpreted according to [numpunct::grouping\(\)](#) and [numpunct::thousands_sep\(\)](#). If the pattern of digit groups isn't consistent, sets err to [ios_base::failbit](#).

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to [ios_base::failbit](#) and leaves *v* unaltered. Sets err to [ios_base::eofbit](#) if the stream is emptied.

Parameters

in Start of input stream.
end End of input stream.
io Source of locale and flags.

err Error flags to set.

v Value to format and insert.

Returns

Iterator after reading.

Definition at line 2058 of file locale_facets.h.

References std::num_get< _CharT, _InIter >::do_get().

```
5.576.4.14 template<typename _CharT , typename _InIter > iter_type  
std::num_get< _CharT, _InIter >::get ( iter_type __in, iter_type  
__end, ios_base & __io, ios_base::iostate & __err, void *& __v )  
const [inline]
```

Numeric parsing.

Parses the input stream into the pointer variable *v*. It does so by calling [num_get::do_get\(\)](#).

The input characters are parsed like the scanf *p* specifier.

Digit grouping is interpreted according to [num_punct::grouping\(\)](#) and [num_punct::thousands_sep\(\)](#). If the pattern of digit groups isn't consistent, sets *err* to [ios_base::failbit](#).

Note that the digit grouping effect for pointers is a bit ambiguous in the standard and shouldn't be relied on. See DR 344.

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets *err* to [ios_base::failbit](#) and leaves *v* unaltered. Sets *err* to [ios_base::eofbit](#) if the stream is emptied.

Parameters

in Start of input stream.

end End of input stream.

io Source of locale and flags.

err Error flags to set.

v Value to format and insert.

Returns

Iterator after reading.

Definition at line 2095 of file locale_facets.h.

References std::num_get< _CharT, _InIter >::do_get().

5.576.4.15 `template<typename _CharT, typename _InIter> iter_type
std::num_get<_CharT, _InIter>::get(iter_type __in, iter_type
__end, ios_base & __io, ios_base::iostate & __err, unsigned long
& __v) const [inline]`

Numeric parsing.

Parses the input stream into the integral variable *v*. It does so by calling [num_get::do_get\(\)](#).

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of `io.flags()` & [ios_base::basefield](#). If equal to [ios_base::oct](#), parses like the `scanf o` specifier. Else if equal to [ios_base::hex](#), parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used.

Digit grouping is interpreted according to [num_punct::grouping\(\)](#) and [num_punct::thousands_sep\(\)](#). If the pattern of digit groups isn't consistent, sets `err` to [ios_base::failbit](#).

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets `err` to [ios_base::failbit](#) and leaves *v* unaltered. Sets `err` to [ios_base::eofbit](#) if the stream is emptied.

Parameters

- in* Start of input stream.
- end* End of input stream.
- io* Source of locale and flags.
- err* Error flags to set.
- v* Value to format and insert.

Returns

Iterator after reading.

Definition at line 2009 of file `locale_facets.h`.

References [std::num_get<_CharT, _InIter>::do_get\(\)](#).

5.576.4.16 `template<typename _CharT, typename _InIter> iter_type
std::num_get<_CharT, _InIter>::get(iter_type __in, iter_type
__end, ios_base & __io, ios_base::iostate & __err, bool & __v)
const [inline]`

Numeric parsing.

Parses the input stream into the bool *v*. It does so by calling `num_get::do_get()`.

If `ios_base::boolalpha` is set, attempts to read `ctype<CharT>::truenamename()` or `ctype<CharT>::falsenamename()`. Sets *v* to true or false if successful. Sets *err* to `ios_base::failbit` if reading the string fails. Sets *err* to `ios_base::eofbit` if the stream is emptied.

If `ios_base::boolalpha` is not set, proceeds as with reading a long, except if the value is 1, sets *v* to true, if the value is 0, sets *v* to false, and otherwise set *err* to `ios_base::failbit`.

Parameters

- in* Start of input stream.
- end* End of input stream.
- io* Source of locale and flags.
- err* Error flags to set.
- v* Value to format and insert.

Returns

Iterator after reading.

Definition at line 1958 of file `locale_facets.h`.

References `std::num_get< _CharT, _InIter >::do_get()`.

Referenced by `std::basic_istream< _CharT, _Traits >::operator>>()`.

Parses the input stream into the integral variable *v*. It does so by calling [num_get::do_get\(\)](#).

Parsing is affected by the flag settings in *io*.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf` `o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used.

Digit grouping is interpreted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. If the pattern of digit groups isn't consistent, sets `err` to `ios_base::failbit`.

If parsing the string yields a valid value for `v`, `v` is set. Otherwise, sets `err` to `ios_base::failbit` and leaves `v` unaltered. Sets `err` to `ios_base::eofbit` if the stream is emptied.

Parameters

- in* Start of input stream.
- end* End of input stream.
- io* Source of locale and flags.
- err* Error flags to set.
- v* Value to format and insert.

Returns

Iterator after reading.

Definition at line 2015 of file `locale_facets.h`.

References `std::num_get< _CharT, _InIter >::do_get()`.

```
5.576.4.22 template<typename _CharT , typename _InIter > iter_type
std::num_get< _CharT, _InIter >::get ( iter_type __in, iter_type
__end, ios_base & __io, ios_base::iostate & __err, unsigned short
& __v ) const [inline]
```

Numeric parsing.

Parses the input stream into the integral variable `v`. It does so by calling `num_get::do_get()`.

Parsing is affected by the flag settings in `io`.

The basic parse is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, parses like the `scanf` `o` specifier. Else if equal to `ios_base::hex`, parses like `X` specifier. Else if `basefield` equal to 0, parses like the `i` specifier. Otherwise, parses like `d` for signed and `u` for unsigned types. The matching type length modifier is also used.

Digit grouping is interpreted according to [numpunct::grouping\(\)](#) and [numpunct::thousands_sep\(\)](#). If the pattern of digit groups isn't consistent, sets err to [ios_base::failbit](#).

If parsing the string yields a valid value for *v*, *v* is set. Otherwise, sets err to [ios_base::failbit](#) and leaves *v* unaltered. Sets err to [ios_base::eofbit](#) if the stream is emptied.

Parameters

- in* Start of input stream.
- end* End of input stream.
- io* Source of locale and flags.
- err* Error flags to set.
- v* Value to format and insert.

Returns

Iterator after reading.

5.577.1 Detailed Description

template<typename _CharT, typename _OutIter> class std::num_put<_CharT, _OutIter>

Primary class template [num_put](#).

This facet encapsulates the code to convert a number to a string. It is used by the ostream numeric insertion operators. The [num_put](#) template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the [num_put](#) facet.

Definition at line 2249 of file locale_facets.h.

5.577.2 Member Typedef Documentation

5.577.3 Constructor & Destructor Documentation

5.577.3.1 `template<typename _CharT, typename _OutIter > std::num_put<_CharT, _OutIter >::num_put (size_t __refs = 0) [inline, explicit]`

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

refs Passed to the base facet class.

Definition at line 2270 of file locale_facets.h.

5.577.3.2 `template<typename _CharT, typename _OutIter > virtual std::num_put< _CharT, _OutIter >::~~num_put () [inline, protected, virtual]`

Destructor.

Definition at line 2449 of file locale_facets.h.

5.577.4 Member Function Documentation

5.577.4.1 `template<typename _CharT, typename _OutIter > virtual iter_type std::num_put< _CharT, _OutIter >::do_put (iter_type __s, ios_base & __io, char_type __fill, unsigned long __v) const [inline, protected, virtual]`

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

s Stream to write to.

io Source of locale and flags.

fill Char_type to use for filling.

v Value to format and insert.

Returns

Iterator after writing.

Definition at line 2473 of file locale_facets.h.

5.577.4.2 `template<typename _CharT, typename _OutIter > virtual
iter_type std::num_put<_CharT, _OutIter >::do_put (iter_type
__s, ios_base & __io, char_type __fill, long long __v) const
[inline, protected, virtual]`

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

s Stream to write to.

io Source of locale and flags.

fill Char_type to use for filling.

v Value to format and insert.

Returns

Iterator after writing.

Definition at line 2479 of file locale_facets.h.

5.577.4.3 `template<typename _CharT, typename _OutIter > virtual iter_type

[protected, virtual]`

Numeric formatting.

These functions do the work of formatting numeric values and inserting them into a stream. This function is a hook for derived classes to change the value returned.

Parameters

- s* Stream to write to.
- io* Source of locale and flags.
- fill* Char_type to use for filling.
- v* Value to format and insert.

Returns

Iterator after writing.

Definition at line 1162 of file locale_facets.tcc.

References `std::ios_base::flags()`, `std::ios_base::hex`, and `std::ios_base::uppercase`.

5.577.4.9 `template<typename _CharT, typename _OutIter > iter_type
std::num_put< _CharT, _OutIter >::put (iter_type __s, ios_base &
__f, char_type __fill, long __v) const [inline]`

Numeric formatting.

Formats the integral value *v* and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of `io.flags()` & `ios_base::basefield`. If equal to `ios_base::oct`, formats like the printf `o` specifier. Else if equal to `ios_base::hex`, formats like `x` or `X` with `ios_base::uppercase` unset or set respectively. Otherwise, formats like `d`, `ld`, `lld` for signed and `u`, `lu`, `llu` for unsigned values. Note that if both `oct` and `hex` are set, neither will take effect.

If `ios_base::showpos` is set, `'+'` is output before positive values. If `ios_base::showbase` is set, `'0'` precedes octal values (except 0) and `'0[xX]'` precedes hex values.

Thousands separators are inserted according to `numput::grouping()` and `numput::thousands_sep()`. The decimal point character used is `numput::decimal_point()`.

If `io.width()` is non-zero, enough *fill* characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

Parameters

- s* Stream to write to.
- io* Source of locale and flags.
- fill* Char_type to use for filling.
- v* Value to format and insert.

Returns

Iterator after writing.

Definition at line 2330 of file locale_facets.h.

If `ios_base::internal`, then padding occurs immediately after either a `'+'` or `'-'` or after `'0x'` or `'0X'`. Otherwise, padding occurs at the beginning.

Parameters

s Stream to write to.
io Source of locale and flags.
fill Char_type to use for filling.

v Value to format and insert.

Returns

Iterator after writing.

Definition at line 2334 of file locale_facets.h.

References std::num_put< _CharT, _OutIter >::do_put().

5.577.4.12 `template<typename _CharT, typename _OutIter > iter_type
std::num_put< _CharT, _OutIter >::put (iter_type __s, ios_base
& __f, char_type __fill, bool __v) const [inline]`

Numeric formatting.

Formats the boolean *v* and inserts it into a stream. It does so by calling [num_put::do_put\(\)](#).

If [ios_base::boolalpha](#) is set, writes ctype<CharT>::truenam() or ctype<CharT>::falsenam(). Otherwise formats *v* as an int.

Parameters

s Stream to write to.

io Source of locale and flags.

fill Char_type to use for filling.

v Value to format and insert.

Returns

Iterator after writing.

Definition at line 2288 of file locale_facets.h.

References std::num_put< _CharT, _OutIter >::do_put().

5.577.4.13 `template<typename _CharT, typename _OutIter > iter_type
std::num_put< _CharT, _OutIter >::put (iter_type __s, ios_base
& __f, char_type __fill, long double __v) const [inline]`

Numeric formatting.

Formats the floating point value *v* and inserts it into a stream. It does so by calling [num_put::do_put\(\)](#).

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of `io.flags()` & `ios_base::floatfield`. If equal to `ios_base::fixed`, formats like the `printf f` specifier. Else if equal to `ios_base::scientific`, formats like `e` or `E` with `ios_base::uppercase` unset or set respectively. Otherwise, formats like `g` or `G` depending on uppercase. Note that if both fixed and scientific are set, the effect will also be like `g` or `G`.

The output precision is given by `io.precision()`. This precision is capped at `numeric_limits::digits10 + 2` (different for double and long double). The default precision is 6.

If `ios_base::showpos` is set, `'+'` is output before positive values. If `ios_base::showpoint` is set, a decimal point will always be output.

Thousands separators are inserted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. The decimal point character used is `num_punct::decimal_point()`.

If `io.width()` is non-zero, enough *fill* characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a `'+'` or `'-'` or after `'0x'` or `'0X'`. Otherwise, padding occurs at the beginning.

Parameters

- s* Stream to write to.
- io* Source of locale and flags.
- fill* Char_type to use for filling.
- v* Value to format and insert.

Returns

Iterator after writing.

Definition at line 2397 of file `locale_facets.h`.

Numeric formatting.

Formats the floating point value *v* and inserts it into a stream. It does so by calling `num_put::do_put()`.

Formatting is affected by the flag settings in *io*.

The basic format is affected by the value of `io.flags()` & `ios_base::floatfield`. If equal to `ios_base::fixed`, formats like the printf *f* specifier. Else if equal to `ios_base::scientific`, formats like *e* or *E* with `ios_base::uppercase` unset or set respectively. Otherwise, formats like *g* or *G* depending on uppercase. Note that if both fixed and scientific are set, the effect will also be like *g* or *G*.

The output precision is given by `io.precision()`. This precision is capped at `numeric_limits::digits10 + 2` (different for double and long double). The default precision is 6.

If `ios_base::showpos` is set, '+' is output before positive values. If `ios_base::showpoint` is set, a decimal point will always be output.

Thousands separators are inserted according to `num_punct::grouping()` and `num_punct::thousands_sep()`. The decimal point character used is `num_punct::decimal_point()`.

If `io.width()` is non-zero, enough *fill* characters are inserted to make the result at least that wide. If `(io.flags() & ios_base::adjustfield) == ios_base::left`, result is padded at the end. If `ios_base::internal`, then padding occurs immediately after either a '+' or '-' or after '0x' or '0X'. Otherwise, padding occurs at the beginning.

Parameters

s Stream to write to.

io Source of locale and flags.

fill Char_type to use for filling.

v Value to format and insert.

Returns

Iterator after writing.

Definition at line 2393 of file locale_facets.h.

5.578.1 Detailed Description

template<typename _Tp> struct std::numeric_limits< _Tp >

Properties of fundamental types. This class allows a program to obtain information about the representation of a fundamental type on a given platform. For non-fundamental types, the functions will return 0 and the data members will all be `false`.

_GLIBCXX_RESOLVE_LIB_DEFECTS: DRs 201 and 184 (hi Gaby!) are noted, but not incorporated in this documented (yet).

Definition at line 284 of file limits.

5.578.2 Member Function Documentation

5.578.2.1 **template<typename _Tp > static _Tp std::numeric_limits< _Tp >::denorm_min () throw () [inline, static]**

The minimum positive denormalized value. For types where `has_denorm` is false, this is the minimum positive normalized value.

Definition at line 313 of file limits.

5.578.2.2 **template<typename _Tp > static _Tp std::numeric_limits< _Tp >::epsilon () throw () [inline, static]**

The *machine epsilon*: the difference between 1 and the least value greater than 1 that is representable.

Definition at line 298 of file limits.

5.578.2.3 **template<typename _Tp > static _Tp std::numeric_limits< _Tp >::infinity () throw () [inline, static]**

The representation of positive infinity, if `has_infinity`.

Definition at line 302 of file limits.

5.578.2.4 **template<typename _Tp > static _Tp std::numeric_limits< _Tp >::lowest () throw () [inline, static]**

A finite value `x` such that there is no other finite value `y` where `y < x`.

Definition at line 294 of file limits.

5.578.2.5 `template<typename _Tp > static _Tp std::numeric_limits< _Tp >::max () throw () [inline, static]`

The maximum finite value.

Definition at line 290 of file limits.

5.578.2.6 `template<typename _Tp > static _Tp std::numeric_limits< _Tp >::min () throw () [inline, static]`

The minimum finite value, or for floating types with denormalization, the minimum positive normalized value.

Definition at line 288 of file limits.

5.578.2.7 `template<typename _Tp > static _Tp std::numeric_limits< _Tp >::quiet_NaN () throw () [inline, static]`

The representation of a quiet *Not a Number*, if has_quiet_NaN.

Definition at line 306 of file limits.

5.578.2.8 `template<typename _Tp > static _Tp std::numeric_limits< _Tp >::round_error () throw () [inline, static]`

The maximum rounding error measurement (see LIA-1).

Definition at line 300 of file limits.

5.578.2.9 `template<typename _Tp > static _Tp std::numeric_limits< _Tp >::signaling_NaN () throw () [inline, static]`

The representation of a signaling *Not a Number*, if has_signaling_NaN.

Definition at line 309 of file limits.

5.578.3 Member Data Documentation

5.578.3.1 `const int std::__numeric_limits_base::digits [static, inherited]`

The number of `radix` digits that be represented without change: for integer types, the number of non-sign bits in the mantissa; for floating types, the number of `radix` digits in the mantissa.

Definition at line 199 of file limits.

5.578.3.2 `const int std::__numeric_limits_base::digits10` `[static, inherited]`

The number of base 10 digits that can be represented without change.

Definition at line 201 of file limits.

5.578.3.3 `const float_denorm_style std::__numeric_limits_base::has_denorm` `[static, inherited]`

See [std::float_denorm_style](#) for more information.

Definition at line 244 of file limits.

5.578.3.4 `const bool std::__numeric_limits_base::has_denorm_loss` `[static, inherited]`

True if loss of accuracy is detected as a denormalization loss, rather than as an inexact result. [18.2.1.2]/42

Definition at line 247 of file limits.

5.578.3.5 `const bool std::__numeric_limits_base::has_infinity` `[static, inherited]`

True if the type has a representation for positive infinity.

Definition at line 236 of file limits.

5.578.3.6 `const bool std::__numeric_limits_base::has_quiet_NaN` `[static, inherited]`

True if the type has a representation for a quiet (non-signaling) *Not a Number*.

Definition at line 239 of file limits.

5.578.3.7 `const bool std::__numeric_limits_base::has_signaling_NaN` `[static, inherited]`

True if the type has a representation for a signaling *Not a Number*.

Definition at line 242 of file limits.

5.578.3.8 `const bool std::__numeric_limits_base::is_bounded` `[static, inherited]`

True if the set of values representable by the type is finite. All built-in types are bounded, this member would be false for arbitrary precision types. [18.2.1.2]/54

Definition at line 255 of file limits.

5.578.3.9 `const bool std::__numeric_limits_base::is_exact` `[static, inherited]`

True if the type uses an exact representation. All integer types are exact, but not all exact types are integer. For example, rational and fixed-exponent representations are exact but not integer. [18.2.1.2]/15

Definition at line 216 of file limits.

5.578.3.10 `const bool std::__numeric_limits_base::is_iec559` `[static, inherited]`

True if-and-only-if the type adheres to the IEC 559 standard, also known as IEEE 754. (Only makes sense for floating point types.)

Definition at line 251 of file limits.

5.578.3.11 `const bool std::__numeric_limits_base::is_integer` `[static, inherited]`

True if the type is integer. Is this supposed to be if the type is integral?

Definition at line 211 of file limits.

5.578.3.12 `const bool std::__numeric_limits_base::is_modulo` `[static, inherited]`

True if the type is modulo, that is, if it is possible to add two positive numbers and have a result that wraps around to a third number that is less. Typically false for floating types, true for unsigned integers, and true for signed integers.

Definition at line 260 of file limits.

5.578.3.13 `const bool std::__numeric_limits_base::is_signed` `[static, inherited]`

True if the type is signed.

Definition at line 208 of file limits.

5.578.3.14 `const bool std::__numeric_limits_base::is_specialized` `[static, inherited]`

This will be true for all fundamental types (which have specializations), and false for everything else.

Definition at line 194 of file limits.

5.578.3.15 `const int std::__numeric_limits_base::max_digits10` `[static, inherited]`

The number of base 10 digits required to ensure that values which differ are always differentiated.

Definition at line 205 of file limits.

5.578.3.16 `const int std::__numeric_limits_base::max_exponent` `[static, inherited]`

The maximum positive integer such that `radix` raised to the power of (one less than that integer) is a representable finite floating point number.

Definition at line 230 of file limits.

5.578.3.17 `const int std::__numeric_limits_base::max_exponent10` `[static, inherited]`

The maximum positive integer such that 10 raised to that power is in the range of representable finite floating point numbers.

Definition at line 233 of file limits.

5.578.3.18 `const int std::__numeric_limits_base::min_exponent` `[static, inherited]`

The minimum negative integer such that `radix` raised to the power of (one less than that integer) is a normalized floating point number.

Definition at line 223 of file limits.

5.578.3.19 `const int std::__numeric_limits_base::min_exponent10` `[static, inherited]`

The minimum negative integer such that 10 raised to that power is in the range of normalized floating point numbers.

Definition at line 226 of file limits.

5.578.3.20 `const int std::__numeric_limits_base::radix` `[static, inherited]`

For integer types, specifies the base of the representation. For floating types, specifies the base of the exponent representation.

Definition at line 219 of file limits.

5.578.3.21 `const float_round_style std::__numeric_limits_base::round_style` `[static, inherited]`

See [std::float_round_style](#) for more information. This is only meaningful for floating types; integer types will all be `round_toward_zero`.

Definition at line 269 of file limits.

5.578.3.22 `const bool std::__numeric_limits_base::tinyness_before` `[static, inherited]`

True if tininess is detected before rounding. (see IEC 559)

Definition at line 265 of file limits.

5.578.3.23 `const bool std::__numeric_limits_base::traps` `[static, inherited]`

True if trapping is implemented for this type.

Definition at line 263 of file limits.

5.597.1 Detailed Description

template<typename _CharT> class std::numpunct<_CharT>

Primary class template numpunct.

This facet stores several pieces of information related to printing and scanning numbers, such as the decimal point character. It takes a template parameter specifying the char type. The numpunct facet is used by streams for many I/O operations involving numbers. The numpunct template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from a numpunct facet.

Definition at line 1637 of file locale_facets.h.

5.597.2 Member Typedef Documentation

5.597.2.1 template<typename _CharT> typedef _CharT std::numpunct<_CharT>::char_type

Public typedefs.

Reimplemented in [std::numpunct_byname<_CharT>](#).

Definition at line 1643 of file locale_facets.h.

5.597.2.2 template<typename _CharT> typedef basic_string<_CharT> std::numpunct<_CharT>::string_type

Public typedefs.

Reimplemented in [std::numpunct_byname<_CharT>](#).

Definition at line 1644 of file locale_facets.h.

5.597.3 Constructor & Destructor Documentation

5.597.3.1 template<typename _CharT> std::numpunct<_CharT>::numpunct (size_t __refs = 0) [inline, explicit]

Numpunct constructor.

Parameters

refs Refcount to pass to the base class.

Definition at line 1661 of file locale_facets.h.

```
5.597.3.2  template<typename _CharT > std::num_punct< _CharT
            >::num_punct ( __cache_type * __cache, size_t __refs = 0 )
            [inline, explicit]
```

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up the predefined locale facets.

Parameters

cache __num_punct_cache object.

refs Refcount to pass to the base class.

Definition at line 1675 of file locale_facets.h.

```
5.597.3.3  template<typename _CharT > std::num_punct< _CharT
            >::num_punct ( __c_locale __cloc, size_t __refs = 0 ) [inline,
            explicit]
```

Internal constructor. Not for general use.

This is a constructor for use by the library itself to set up new locales.

Parameters

cloc The C locale.

refs Refcount to pass to the base class.

Definition at line 1689 of file locale_facets.h.

```
5.597.3.4  template<typename _CharT > virtual std::num_punct< _CharT
            >::~~num_punct ( ) [protected, virtual]
```

Destructor.

5.597.4 Member Function Documentation

```
5.597.4.1  template<typename _CharT > char_type std::num_punct< _CharT
            >::decimal_point ( ) const [inline]
```

Return decimal point character.

This function returns a `char_type` to use as a decimal point. It does so by returning returning `num_punct<char_type>::do_decimal_point()`.

Returns

char_type representing a decimal point.

Definition at line 1703 of file `locale_facets.h`.

References `std::num_punct<_CharT>::do_decimal_point()`.

5.597.4.2 `template<typename _CharT> virtual char_type std::num_punct<_CharT>::do_decimal_point() const [inline, protected, virtual]`

Return decimal point character.

Returns a `char_type` to use as a decimal point. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a decimal point.

Definition at line 1790 of file `locale_facets.h`.

Referenced by `std::num_punct<_CharT>::decimal_point()`.

5.597.4.3 `template<typename _CharT> virtual string_type std::num_punct<_CharT>::do_falsename() const [inline, protected, virtual]`

Return string representation of bool false.

Returns a `string_type` containing the text representation for false bool variables. This function is a hook for derived classes to change the value returned.

Returns

`string_type` representing printed form of false.

Definition at line 1841 of file `locale_facets.h`.

Referenced by `std::num_punct<_CharT>::falsename()`.

5.597.4.4 `template<typename _CharT > virtual string std::num_punct<_CharT >::do_grouping() const [inline, protected, virtual]`

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

See also

[grouping\(\)](#) for details.

Returns

String representing grouping specification.

Definition at line 1815 of file locale_facets.h.

Referenced by `std::num_punct< _CharT >::grouping()`.

5.597.4.5 `template<typename _CharT > virtual char_type std::num_punct<_CharT >::do_thousands_sep() const [inline, protected, virtual]`

Return thousands separator character.

Returns a `char_type` to use as a thousands separator. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a thousands separator.

Definition at line 1802 of file locale_facets.h.

Referenced by `std::num_punct< _CharT >::thousands_sep()`.

5.597.4.6 `template<typename _CharT > virtual string_type std::num_punct<_CharT >::do_truename() const [inline, protected, virtual]`

Return string representation of bool true.

Returns a `string_type` containing the text representation for true bool variables. This function is a hook for derived classes to change the value returned.

Returns

`string_type` representing printed form of true.

Definition at line 1828 of file locale_facets.h.

Referenced by std::num_punct<_CharT>::true_name().

5.597.4.7 template<typename _CharT> string_type std::num_punct<_CharT>::false_name() const [inline]

Return string representation of bool false.

This function returns a string_type containing the text representation for false bool variables. It does so by calling [num_punct<char_type>::do_false_name\(\)](#).

Returns

string_type representing printed form of false.

Definition at line 1773 of file locale_facets.h.

References std::num_punct<_CharT>::do_false_name().

5.597.4.8 template<typename _CharT> string std::num_punct<_CharT>::grouping() const [inline]

Return grouping specification.

This function returns a string representing groupings for the integer part of a number. Groupings indicate where thousands separators should be inserted in the integer part of a number.

Each char in the return string is interpreted as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the [grouping\(\)](#) returns "\003\002" and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was "32", this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling [num_punct<char_type>::do_grouping\(\)](#).

Returns

string representing grouping specification.

Definition at line 1747 of file locale_facets.h.

References std::num_punct<_CharT>::do_grouping().

5.597.4.9 `template<typename _CharT > char_type std::numpunct< _CharT >::thousands_sep () const [inline]`

Return thousands separator character.

This function returns a `char_type` to use as a thousands separator. It does so by returning `numpunct<char_type>::do_thousands_sep()`.

Returns

`char_type` representing a thousands separator.

Definition at line 1716 of file `locale_facets.h`.

References `std::numpunct< _CharT >::do_thousands_sep()`.

5.597.4.10 `template<typename _CharT > string_type std::numpunct< _CharT >::truename () const [inline]`

Return string representation of bool true.

This function returns a `string_type` containing the text representation for true bool variables. It does so by calling `numpunct<char_type>::do_truename()`.

Returns

`string_type` representing printed form of true.

Definition at line 1760 of file `locale_facets.h`.

References `std::numpunct< _CharT >::do_truename()`.

5.597.5 Member Data Documentation

5.597.5.1 `template<typename _CharT > locale::id std::numpunct< _CharT >::id [static]`

Numpunct facet id.

Definition at line 1653 of file `locale_facets.h`.

5.598.1 Detailed Description

`template<typename _CharT> class std::numpunct_byname< _CharT >`

class [numpunct_byname](#) [22.2.3.2].

Definition at line 1870 of file `locale_facets.h`.

5.598.2 Member Typedef Documentation

5.598.2.1 `template<typename _CharT > typedef _CharT std::num_punct_byname< _CharT >::char_type`

Public typedefs.

Reimplemented from [std::num_punct< _CharT >](#).

Definition at line 1873 of file locale_facets.h.

5.598.2.2 `template<typename _CharT > typedef basic_string<_CharT> std::num_punct_byname< _CharT >::string_type`

Public typedefs.

Reimplemented from [std::num_punct< _CharT >](#).

Definition at line 1874 of file locale_facets.h.

5.598.3 Member Function Documentation

5.598.3.1 `template<typename _CharT > char_type std::num_punct< _CharT >::decimal_point() const [inline, inherited]`

Return decimal point character.

This function returns a `char_type` to use as a decimal point. It does so by returning [num_punct<char_type>::do_decimal_point\(\)](#).

Returns

char_type representing a decimal point.

Definition at line 1703 of file locale_facets.h.

References [std::num_punct< _CharT >::do_decimal_point\(\)](#).

5.598.3.2 `template<typename _CharT > virtual char_type std::num_punct< _CharT >::do_decimal_point() const [inline, protected, virtual, inherited]`

Return decimal point character.

Returns a `char_type` to use as a decimal point. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a decimal point.

Definition at line 1790 of file locale_facets.h.

Referenced by `std::num_punct<_CharT>::decimal_point()`.

5.598.3.3 template<typename _CharT> virtual string_type std::num_punct<_CharT>::do_falsename() const [inline, protected, virtual, inherited]

Return string representation of bool false.

Returns a *string_type* containing the text representation for false bool variables. This function is a hook for derived classes to change the value returned.

Returns

string_type representing printed form of false.

Definition at line 1841 of file locale_facets.h.

Referenced by `std::num_punct<_CharT>::falsename()`.

5.598.3.4 template<typename _CharT> virtual string std::num_punct<_CharT>::do_grouping() const [inline, protected, virtual, inherited]

Return grouping specification.

Returns a string representing groupings for the integer part of a number. This function is a hook for derived classes to change the value returned.

See also

[grouping\(\)](#) for details.

Returns

String representing grouping specification.

Definition at line 1815 of file locale_facets.h.

Referenced by `std::num_punct<_CharT>::grouping()`.

5.598.3.5 `template<typename _CharT > virtual char_type std::num_punct<_CharT>::do_thousands_sep() const [inline, protected, virtual, inherited]`

Return thousands separator character.

Returns a `char_type` to use as a thousands separator. This function is a hook for derived classes to change the value returned.

Returns

char_type representing a thousands separator.

Definition at line 1802 of file `locale_facets.h`.

Referenced by `std::num_punct< _CharT >::thousands_sep()`.

5.598.3.6 `template<typename _CharT > virtual string_type std::num_punct<_CharT>::do_truename() const [inline, protected, virtual, inherited]`

Return string representation of bool true.

Returns a `string_type` containing the text representation for true bool variables. This function is a hook for derived classes to change the value returned.

Returns

`string_type` representing printed form of true.

Definition at line 1828 of file `locale_facets.h`.

Referenced by `std::num_punct< _CharT >::truename()`.

5.598.3.7 `template<typename _CharT > string_type std::num_punct<_CharT>::falsename() const [inline, inherited]`

Return string representation of bool false.

This function returns a `string_type` containing the text representation for false bool variables. It does so by calling `num_punct<char_type>::do_falsename()`.

Returns

`string_type` representing printed form of false.

Definition at line 1773 of file `locale_facets.h`.

References `std::num_punct< _CharT >::do_falsename()`.

5.598.3.8 `template<typename _CharT > string std::num_punct<_CharT>::grouping() const [inline, inherited]`

Return grouping specification.

This function returns a string representing groupings for the integer part of a number. Groupings indicate where thousands separators should be inserted in the integer part of a number.

Each char in the return string is interpreted as an integer rather than a character. These numbers represent the number of digits in a group. The first char in the string represents the number of digits in the least significant group. If a char is negative, it indicates an unlimited number of digits for the group. If more chars from the string are required to group a number, the last char is used repeatedly.

For example, if the `grouping()` returns `"\003\002"` and is applied to the number 123456789, this corresponds to 12,34,56,789. Note that if the string was `"32"`, this would put more than 50 digits into the least significant group if the character set is ASCII.

The string is returned by calling `num_punct<char_type>::do_grouping()`.

Returns

string representing grouping specification.

Definition at line 1747 of file `locale_facets.h`.

References `std::num_punct<_CharT>::do_grouping()`.

5.598.3.9 `template<typename _CharT > char_type std::num_punct<_CharT>::thousands_sep() const [inline, inherited]`

Return thousands separator character.

This function returns a `char_type` to use as a thousands separator. It does so by returning `num_punct<char_type>::do_thousands_sep()`.

Returns

`char_type` representing a thousands separator.

Definition at line 1716 of file `locale_facets.h`.

References `std::num_punct<_CharT>::do_thousands_sep()`.

5.598.3.10 `template<typename _CharT > string_type std::num_punct<_CharT>::true_name() const [inline, inherited]`

Return string representation of bool true.

This function returns a `string_type` containing the text representation for true bool variables. It does so by calling `numpunct<char_type>::do_truename()`.

Returns

`string_type` representing printed form of true.

Definition at line 1760 of file `locale_facets.h`.

References `std::numpunct<_CharT>::do_truename()`.

5.598.4 Member Data Documentation

5.598.4.1 `template<typename _CharT > locale::id std::numpunct<_CharT>::id [static, inherited]`

Numpunct facet id.

Definition at line 1653 of file `locale_facets.h`.

5.600.1 Detailed Description

`template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>> class std::ostream_iterator<_Tp, _CharT, _Traits>`

Provides output iterator semantics for streams. This class provides an iterator to write to an ostream. The type `Tp` is the only type written by this iterator and there must be an `operator<<(Tp)` defined.

Parameters

Tp The type to write to the ostream.

CharT The ostream `char_type`.

Traits The ostream [char_traits](#).

Definition at line 152 of file `stream_iterator.h`.

5.600.2 Member Typedef Documentation

5.600.2.1 `template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>> typedef _CharT std::ostream_iterator<_Tp, _CharT, _Traits>::char_type`

Public typedef.

Definition at line 158 of file `stream_iterator.h`.

5.600.2.2 `typedef void std::iterator< output_iterator_tag , void , void , void , void >::difference_type [inherited]`

Distance between iterators is represented as this type.

Definition at line 124 of file `stl_iterator_base_types.h`.

5.600.2.3 `typedef output_iterator_tag std::iterator< output_iterator_tag , void , void , void , void >::iterator_category [inherited]`

One of the [tag types](#).

Definition at line 120 of file `stl_iterator_base_types.h`.

5.600.2.4 `template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>> typedef basic_ostream<_CharT, _Traits> std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_type`

Public typedef.

Definition at line 160 of file `stream_iterator.h`.

5.600.2.5 `typedef void std::iterator< output_iterator_tag , void , void , void , void >::pointer [inherited]`

This type represents a pointer-to-value_type.

Definition at line 126 of file `stl_iterator_base_types.h`.

5.600.2.6 `typedef void std::iterator< output_iterator_tag , void , void , void , void >::reference [inherited]`

This type represents a reference-to-value_type.

Definition at line 128 of file `stl_iterator_base_types.h`.

5.600.2.7 `template<typename _Tp , typename _CharT = char, typename _Traits = char_traits<_CharT>> typedef _Traits std::ostream_iterator< _Tp, _CharT, _Traits >::traits_type`

Public typedef.

Definition at line 159 of file `stream_iterator.h`.

5.600.2.8 `typedef void std::iterator< output_iterator_tag, void, void, void, void >::value_type [inherited]`

The type "pointed to" by the iterator.

Definition at line 122 of file stl_iterator_base_types.h.

5.600.3 Constructor & Destructor Documentation

5.600.3.1 `template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>> std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator (ostream_type & __s) [inline]`

Construct from an ostream.

Definition at line 169 of file stream_iterator.h.

5.600.3.2 `template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>> std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator (ostream_type & __s, const _CharT * __c) [inline]`

Construct from an ostream.

The delimiter string *c* is written to the stream after every *Tp* written to the stream. The delimiter is not copied, and thus must not be destroyed while this iterator is in use.

Parameters

s Underlying ostream to write to.

c CharT delimiter string to insert.

Definition at line 181 of file stream_iterator.h.

5.600.3.3 `template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>> std::ostream_iterator< _Tp, _CharT, _Traits >::ostream_iterator (const ostream_iterator< _Tp, _CharT, _Traits > & __obj) [inline]`

Copy constructor.

Definition at line 185 of file stream_iterator.h.

5.600.4 Member Function Documentation

5.600.4.1 `template<typename _Tp, typename _CharT = char, typename _Traits = char_traits<_CharT>> ostream_iterator& std::ostream_iterator<_Tp, _CharT, _Traits>::operator= (const _Tp & __value) [inline]`

Writes *value* to underlying ostream using operator<<. If /// constructed with delimiter string, writes delimiter to ostream.

Definition at line 191 of file stream_iterator.h.

5.608.1 Detailed Description

template<class `_T1`, class `_T2`> struct std::pair< `_T1`, `_T2` >

pair holds two objects of arbitrary type.

Definition at line 84 of file stl_pair.h.

5.608.2 Member Typedef Documentation

5.608.2.1 `template<class _T1, class _T2> typedef _T1 std::pair< _T1, _T2 >::first_type`

`first_type` is the first bound type

Definition at line 86 of file `stl_pair.h`.

5.608.2.2 `template<class _T1, class _T2> typedef _T2 std::pair< _T1, _T2 >::second_type`

`second_type` is the second bound type

Definition at line 87 of file `stl_pair.h`.

5.608.3 Constructor & Destructor Documentation

5.608.3.1 `template<class _T1, class _T2> std::pair< _T1, _T2 >::pair ()
[inline]`

The default constructor creates `first` and `second` using their respective default constructors.

Definition at line 96 of file `stl_pair.h`.

5.608.3.2 `template<class _T1, class _T2> std::pair< _T1, _T2 >::pair (const
_T1 & __a, const _T2 & __b) [inline]`

Two objects may be passed to a `pair` constructor to be copied.

Definition at line 100 of file `stl_pair.h`.

5.608.3.3 `template<class _T1, class _T2> template<class _U1, class _U2 >
std::pair< _T1, _T2 >::pair (const pair< _U1, _U2 > & __p)
[inline]`

There is also a templated copy ctor for the `pair` class itself.

Definition at line 136 of file `stl_pair.h`.

5.608.4 Member Data Documentation

5.608.4.1 `template<class _T1, class _T2> _T1 std::pair< _T1, _T2 >::first`

`first` is a copy of the first object

Definition at line 89 of file `stl_pair.h`.

Referenced by `std::_Temporary_buffer< _ForwardIterator, _Tp >::_Temporary_buffer()`, `std::set< _StateIdT >::insert()`, and `std::operator==()`.

5.608.4.2 `template<class _T1, class _T2> _T2 std::pair< _T1, _T2 >::second`

`second` is a copy of the second object

Definition at line 90 of file `stl_pair.h`.

Referenced by `std::_Temporary_buffer< _ForwardIterator, _Tp >::_Temporary_buffer()`, `std::set< _StateIdT >::insert()`, and `std::operator==()`.

5.609.1 Detailed Description

`template<typename _RealType = double> class std::piecewise_constant_distribution<_RealType>`

A [piecewise_constant_distribution](#) random number distribution. The formula for the piecewise constant probability mass function is

Definition at line 4877 of file random.h.

5.609.2 Member Typedef Documentation

5.609.2.1 `template<typename _RealType = double> typedef _RealType
std::piecewise_constant_distribution< _RealType >::result_type`

The type of the range of the distribution.

Definition at line 4884 of file random.h.

5.609.3 Member Function Documentation

5.609.3.1 `template<typename _RealType = double> std::vector<double>
std::piecewise_constant_distribution< _RealType >::densities ()
const [inline]`

Returns a vector of the probability densities.

Definition at line 4976 of file random.h.

5.609.3.2 `template<typename _RealType = double> std::vector<_RealType>
std::piecewise_constant_distribution< _RealType >::intervals ()
const [inline]`

Returns a vector of the intervals.

Definition at line 4969 of file random.h.

5.609.3.3 `template<typename _RealType = double> result_type
std::piecewise_constant_distribution< _RealType >::max () const
[inline]`

Returns the least upper bound value of the distribution.

Definition at line 5005 of file random.h.

References `std::vector< _Tp, _Alloc >::back()`.

5.609.3.4 `template<typename _RealType = double> result_type
std::piecewise_constant_distribution< _RealType >::min () const
[inline]`

Returns the greatest lower bound value of the distribution.

Definition at line 4998 of file random.h.

References `std::vector< _Tp, _Alloc >::front()`.

5.609.3.5 `template<typename _RealType = double> template<typename
_UniformRandomNumberGenerator > result_type
std::piecewise_constant_distribution< _RealType >::operator() (
_UniformRandomNumberGenerator & __urng) [inline]`

Generating functions.

Definition at line 5013 of file random.h.

References `std::piecewise_constant_distribution< _RealType >::operator()`, and
`std::piecewise_constant_distribution< _RealType >::param()`.

Referenced by `std::piecewise_constant_distribution< _RealType >::operator()`.

5.609.3.6 `template<typename _RealType = double> void
std::piecewise_constant_distribution< _RealType >::param (const
param_type & __param) [inline]`

Sets the parameter set of the distribution.

Parameters

`__param` The new parameter set of the distribution.

Definition at line 4991 of file random.h.

5.609.3.7 `template<typename _RealType = double> param_type
std::piecewise_constant_distribution< _RealType >::param ()
const [inline]`

Returns the parameter set of the distribution.

Definition at line 4983 of file random.h.

Referenced by `std::piecewise_constant_distribution< _RealType >::operator()`, and
`std::operator==()`.

5.609.3.8 `template<typename _RealType = double> void
std::piecewise_constant_distribution< _RealType >::reset ()
[inline]`

Resets the distribution state.

Definition at line 4962 of file random.h.

5.609.4 Friends And Related Function Documentation

5.609.4.1 `template<typename _RealType = double> template<typename
_RealType1 , typename _CharT , typename _Traits >
std::basic_ostream<_CharT, _Traits>& operator<<
(std::basic_ostream< _CharT, _Traits > & , const
std::piecewise_constant_distribution< _RealType1 > &)
[friend]`

Inserts a `piecewise_constan_distribution` random number distribution `__x` into the output stream `__os`.

Parameters

`__os` An output stream.

`__x` A `piecewise_constan_distribution` random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

5.609.4.2 `template<typename _RealType = double> template<typename
_RealType1 , typename _CharT , typename _Traits > std::basic_
istream<_CharT, _Traits>& operator>> (std::basic_istream<
_CharT, _Traits > & , std::piecewise_constant_distribution<
_RealType1 > &) [friend]`

Extracts a `piecewise_constan_distribution` random number distribution `__x` from the input stream `__is`.

Parameters

`__is` An input stream.

`__x` A `piecewise_constan_distribution` random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

5.616.2 Member Typedef Documentation

5.616.2.1 template<typename _IntType = int> typedef _IntType
std::poisson_distribution< _IntType >::result_type

The type of the range of the distribution.

Definition at line 3983 of file random.h.

5.616.3 Member Function Documentation

5.616.3.1 `template<typename _IntType = int> result_type
std::poisson_distribution< _IntType >::max () const [inline]`

Returns the least upper bound value of the distribution.

Definition at line 4070 of file random.h.

Referenced by `std::poisson_distribution< _IntType >::operator()()`.

5.616.3.2 `template<typename _IntType = int> double
std::poisson_distribution< _IntType >::mean () const [inline]`

Returns the distribution parameter `mean`.

Definition at line 4041 of file random.h.

5.616.3.3 `template<typename _IntType = int> result_type
std::poisson_distribution< _IntType >::min () const [inline]`

Returns the greatest lower bound value of the distribution.

Definition at line 4063 of file random.h.

5.616.3.4 `template<typename _IntType > template<typename
_UniformRandomNumberGenerator > poisson_distribution<
_IntType >::result_type std::poisson_distribution< _IntType
>::operator() (_UniformRandomNumberGenerator & __urng,
const param_type & __param)`

A rejection algorithm when `mean >= 12` and a simple method based upon the multiplication of uniform random variates otherwise. NB: The former is available only if `_GLIBCXX_USE_C99_MATH_TR1` is defined.

Reference: Devroye, L. Non-Uniform Random Variates Generation. Springer-Verlag, New York, 1986, Ch. X, Sects. 3.3 & 3.4 (+ Errata!).

Definition at line 1195 of file random.tcc.

References `std::abs()`, `std::log()`, and `std::poisson_distribution< _IntType >::max()`.

5.616.3.5 `template<typename _IntType = int> template<typename
_UniformRandomNumberGenerator > result_type
std::poisson_distribution< _IntType >::operator() (
_UniformRandomNumberGenerator & __urng) [inline]`

Generating functions.

Definition at line 4078 of file random.h.

References std::poisson_distribution< _IntType >::operator>(), and std::poisson_distribution< _IntType >::param().

Referenced by std::poisson_distribution< _IntType >::operator().

5.616.3.6 `template<typename _IntType = int> param_type
std::poisson_distribution< _IntType >::param () const
[inline]`

Returns the parameter set of the distribution.

Definition at line 4048 of file random.h.

Referenced by std::poisson_distribution< _IntType >::operator().

5.616.3.7 `template<typename _IntType = int> void std::poisson_distribution<
_IntType >::param (const param_type & __param) [inline]`

Sets the parameter set of the distribution.

Parameters

__param The new parameter set of the distribution.

Definition at line 4056 of file random.h.

5.616.3.8 `template<typename _IntType = int> void std::poisson_distribution<
_IntType >::reset () [inline]`

Resets the distribution state.

Definition at line 4034 of file random.h.

References std::normal_distribution< _RealType >::reset().

5.616.4 Friends And Related Function Documentation

5.616.4.1 `template<typename _IntType = int> template<typename _IntType1 ,
typename _CharT , typename _Traits > std::basic_ostream<_CharT,
_Traits>& operator<< (std::basic_ostream< _CharT, _Traits > & ,
const std::poisson_distribution< _IntType1 > &) [friend]`

Inserts a poisson_distribution random number distribution `__x` into the output stream `__os`.

Parameters

`__os` An output stream.

`__x` A poisson_distribution random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

5.616.4.2 `template<typename _IntType = int> template<typename _IntType1
> bool operator==(const std::poisson_distribution< _IntType1 >
& __d1, const std::poisson_distribution< _IntType1 > & __d2)
[friend]`

Return true if two Poisson distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 4093 of file random.h.

5.616.4.3 `template<typename _IntType = int> template<typename _IntType1 ,
typename _CharT , typename _Traits > std::basic_istream<_CharT,
_Traits>& operator>> (std::basic_istream< _CharT, _Traits > & ,
std::poisson_distribution< _IntType1 > &) [friend]`

Extracts a poisson_distribution random number distribution `__x` from the input stream `__is`.

Parameters

`__is` An input stream.

`__x` A poisson_distribution random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

5.618.1 Detailed Description

```
template<typename _Tp, typename _Sequence = vector<_Tp>, typename _-
Compare = less<typename _Sequence::value_type>> class std::priority_queue<
_Tp, _Sequence, _Compare >
```

A standard container automatically sorting its contents. This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces priority-based sorting and queue behavior. Very few of the standard container/sequence interface requirements are met (e.g., iterators).

The second template parameter defines the type of the underlying sequence/container. It defaults to `std::vector`, but it can be any type that supports `front()`, `push_back`, `pop_back`, and random-access iterators, such as `std::deque` or an appropriate user-defined type.

The third template parameter supplies the means of making priority comparisons. It defaults to `less<value_type>` but can be anything defining a strict weak ordering.

Members not found in *normal* containers are `container_type`, which is a typedef for the second Sequence parameter, and `push`, `pop`, and `top`, which are standard queue operations.

Note

No equality/comparison operators are provided for `priority_queue`. Sorting of the elements takes place as they are added to, and removed from, the `priority_queue` using the `priority_queue`'s member functions. If you access the elements by other means, and change their data such that the sorting order would be different, the `priority_queue` will not re-sort the elements for you. (How could it know to do so?)

Definition at line 353 of file `stl_queue.h`.

5.618.2 Constructor & Destructor Documentation

5.618.2.1 `template<typename _Tp, typename _Sequence = vector<_Tp>,
typename _Compare = less<typename _Sequence::value_type>>
std::priority_queue< _Tp, _Sequence, _Compare >::priority_queue (
const _Compare & __x, const _Sequence & __s) [inline,
explicit]`

Default constructor creates no elements.

Definition at line 388 of file `stl_queue.h`.

References `std::make_heap()`.

5.618.2.2 `template<typename _Tp, typename _Sequence = vector<_Tp>,
typename _Compare = less<typename _Sequence::value_type>>
template<typename _InputIterator > std::priority_queue< _Tp,
_Sequence, _Compare >::priority_queue (_InputIterator __first,
_InputIterator __last, const _Compare & __x, const _Sequence &
__s) [inline]`

Builds a queue from a range.

Parameters

first An input iterator.
last An input iterator.
x A comparison functor describing a strict weak ordering.
s An initial sequence with which to start.

Begins by copying *s*, inserting a copy of the elements from [*first*,*last*) into the copy of *s*, then ordering the copy according to *x*.

For more information on function objects, see the documentation on [functor base classes](#).

Definition at line 428 of file `stl_queue.h`.

References `std::make_heap()`.

5.618.3 Member Function Documentation

5.618.3.1 `template<typename _Tp, typename _Sequence = vector<_Tp>,
typename _Compare = less<typename _Sequence::value_type>>
bool std::priority_queue<_Tp, _Sequence, _Compare>::empty ()
const [inline]`

Returns true if the queue is empty.

Definition at line 454 of file `stl_queue.h`.

Referenced by `__gnu_parallel::multiseq_partition()`, and `__gnu_parallel::multiseq_selection()`.

5.618.3.2 `template<typename _Tp, typename _Sequence = vector<_Tp>,
typename _Compare = less<typename _Sequence::value_type>>
void std::priority_queue<_Tp, _Sequence, _Compare>::pop ()
[inline]`

Removes first element.

This is a typical queue operation. It shrinks the queue by one. The time complexity of the operation depends on the underlying sequence.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop()` is called.

Definition at line 517 of file `stl_queue.h`.

References `std::pop_heap()`.

Referenced by `__gnu_parallel::multiseq_partition()`, and `__gnu_parallel::multiseq_selection()`.

5.618.3.3 `template<typename _Tp, typename _Sequence = vector<_Tp>,
typename _Compare = less<typename _Sequence::value_type>>
void std::priority_queue< _Tp, _Sequence, _Compare >::push (
const value_type & __x) [inline]`

Add data to the queue.

Parameters

x Data to be added.

This is a typical queue operation. The time complexity of the operation depends on the underlying sequence.

Definition at line 482 of file `stl_queue.h`.

References `std::push_heap()`.

Referenced by `__gnu_parallel::multiseq_partition()`, and `__gnu_parallel::multiseq_selection()`.

5.618.3.4 `template<typename _Tp, typename _Sequence = vector<_Tp>,
typename _Compare = less<typename _Sequence::value_type>>
size_type std::priority_queue< _Tp, _Sequence, _Compare >::size (
) const [inline]`

Returns the number of elements in the queue.

Definition at line 459 of file `stl_queue.h`.

5.618.3.5 `template<typename _Tp, typename _Sequence = vector<_Tp>,
typename _Compare = less<typename _Sequence::value_type>>
const_reference std::priority_queue< _Tp, _Sequence, _Compare
>::top () const [inline]`

Returns a read-only (constant) reference to the data at the first element of the queue.

Definition at line 467 of file `stl_queue.h`.

Referenced by `__gnu_parallel::multiseq_partition()`, and `__gnu_parallel::multiseq_selection()`.

5.622.1 Detailed Description

`template<typename _Tp, typename _Sequence = deque<_Tp>> class std::queue< _Tp, _Sequence >`

A standard container giving FIFO behavior. Meets many of the requirements of a `container`, but does not define anything to do with iterators. Very few of the other standard container interfaces are defined.

This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces strict first-in-first-out queue behavior.

The second template parameter defines the type of the underlying sequence/container. It defaults to `std::deque`, but it can be any type that supports `front`, `back`, `push_back`, and `pop_front`, such as `std::list` or an appropriate user-defined type.

Members not found in *normal* containers are `container_type`, which is a typedef for the second Sequence parameter, and `push` and `pop`, which are standard queue/FIFO operations.

Definition at line 89 of file `stl_queue.h`.

5.622.2 Constructor & Destructor Documentation

5.622.2.1 `template<typename _Tp, typename _Sequence = deque<_Tp>>
std::queue<_Tp, _Sequence>::queue (const _Sequence & __c)
[inline, explicit]`

Default constructor creates no elements.

Definition at line 134 of file `stl_queue.h`.

5.622.3 Member Function Documentation

5.622.3.1 `template<typename _Tp, typename _Sequence = deque<_Tp>>
reference std::queue<_Tp, _Sequence>::back () [inline]`

Returns a read/write reference to the data at the last element of the queue.

Definition at line 181 of file `stl_queue.h`.

5.622.3.2 `template<typename _Tp, typename _Sequence = deque<_Tp>>
const_reference std::queue<_Tp, _Sequence>::back () const
[inline]`

Returns a read-only (constant) reference to the data at the last element of the queue.

Definition at line 192 of file `stl_queue.h`.

5.622.3.3 `template<typename _Tp, typename _Sequence = deque<_Tp>>
bool std::queue<_Tp, _Sequence>::empty () const [inline]`

Returns true if the queue is empty.

Definition at line 146 of file `stl_queue.h`.

5.622.3.4 `template<typename _Tp, typename _Sequence = deque<_Tp>>
const_reference std::queue<_Tp, _Sequence>::front () const
[inline]`

Returns a read-only (constant) reference to the data at the first element of the queue.

Definition at line 170 of file `stl_queue.h`.

5.622.3.5 `template<typename _Tp, typename _Sequence = deque<_Tp>>
reference std::queue< _Tp, _Sequence >::front () [inline]`

Returns a read/write reference to the data at the first element of the queue.

Definition at line 159 of file stl_queue.h.

5.622.3.6 `template<typename _Tp, typename _Sequence = deque<_Tp>>
void std::queue< _Tp, _Sequence >::pop () [inline]`

Removes first element.

This is a typical queue operation. It shrinks the queue by one. The time complexity of the operation depends on the underlying sequence.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before `pop()` is called.

Definition at line 234 of file stl_queue.h.

5.622.3.7 `template<typename _Tp, typename _Sequence = deque<_Tp>>
void std::queue< _Tp, _Sequence >::push (const value_type & __x
) [inline]`

Add data to the end of the queue.

Parameters

x Data to be added.

This is a typical queue operation. The function creates an element at the end of the queue and assigns the given data to it. The time complexity of the operation depends on the underlying sequence.

Definition at line 208 of file stl_queue.h.

5.622.3.8 `template<typename _Tp, typename _Sequence = deque<_Tp>>
size_type std::queue< _Tp, _Sequence >::size () const [inline]`

Returns the number of elements in the queue.

Definition at line 151 of file stl_queue.h.

5.622.4 Member Data Documentation

5.622.4.1 `template<typename _Tp, typename _Sequence = deque<_Tp>>
_Sequence std::queue<_Tp, _Sequence>::c [protected]`

'c' is the underlying container. Maintainers wondering why this isn't uglified as per style guidelines should note that this name is specified in the standard, [23.2.3.1]. (Why? Presumably for the same reason that it's protected instead of private: to allow derivation. But none of the other containers allow for derivation. Odd.)

Definition at line 122 of file `stl_queue.h`.

Referenced by `std::operator==()`.

5.633 `std::raw_storage_iterator< _OutputIterator, _Tp >` Class Template Reference

Inheritance diagram for `std::raw_storage_iterator< _OutputIterator, _Tp >`:

Public Types

- typedef void [difference_type](#)
- typedef [output_iterator_tag](#) `iterator_category`
- typedef void [pointer](#)
- typedef void [reference](#)
- typedef void [value_type](#)

Public Member Functions

- `raw_storage_iterator` (`_OutputIterator __x`)
- `raw_storage_iterator` & `operator*` ()
- `raw_storage_iterator`< `_OutputIterator, _Tp` > & `operator++` ()
- `raw_storage_iterator`< `_OutputIterator, _Tp` > `operator++` (int)
- `raw_storage_iterator` & `operator=` (const `_Tp` & `__element`)

Protected Attributes

- `_OutputIterator _M_iter`

5.633.1 Detailed Description

`template<class _OutputIterator, class _Tp> class std::raw_storage_iterator<_OutputIterator, _Tp>`

This iterator class lets algorithms store their results into uninitialized memory.

Definition at line 67 of file `stl_raw_storage_iter.h`.

5.633.2 Member Typedef Documentation

5.633.2.1 `typedef void std::iterator< output_iterator_tag, void, void, void, void >::difference_type` [*inherited*]

Distance between iterators is represented as this type.

Definition at line 124 of file `stl_iterator_base_types.h`.

5.633.2.2 `typedef output_iterator_tag std::iterator< output_iterator_tag, void, void, void, void >::iterator_category` [*inherited*]

One of the [tag types](#).

Definition at line 120 of file `stl_iterator_base_types.h`.

5.633.2.3 `typedef void std::iterator< output_iterator_tag, void, void, void, void >::pointer` [*inherited*]

This type represents a pointer-to-value_type.

Definition at line 126 of file `stl_iterator_base_types.h`.

5.633.2.4 `typedef void std::iterator< output_iterator_tag , void , void , void , void >::reference [inherited]`

This type represents a reference-to-value_type.

Definition at line 128 of file stl_iterator_base_types.h.

5.633.2.5 `typedef void std::iterator< output_iterator_tag , void , void , void , void >::value_type [inherited]`

The type "pointed to" by the iterator.

Definition at line 122 of file stl_iterator_base_types.h.

The documentation for this class was generated from the following file:

5.637 std::regex_error Class Reference

A regular expression exception class.

The regular expression library throws objects of this class on error.

Inheritance diagram for std::regex_error:

Public Member Functions

- [regex_error](#) ([regex_constants::error_type](#) __ecode)
- [regex_constants::error_type](#) code () const
- virtual const char * [what](#) () const throw ()

Protected Attributes

- [regex_constants::error_type](#) `_M_code`

5.637.1 Detailed Description

A regular expression exception class.

The regular expression library throws objects of this class on error.

Definition at line 127 of file `regex_error.h`.

5.637.2 Constructor & Destructor Documentation

5.637.2.1 `std::regex_error::regex_error (regex_constants::error_type __ecode) [inline, explicit]`

Constructs a [regex_error](#) object.

Parameters

ecode the regex error code.

Definition at line 137 of file `regex_error.h`.

5.637.3 Member Function Documentation

5.637.3.1 `regex_constants::error_type std::regex_error::code () const [inline]`

Gets the regex error code.

Returns

the regex error code.

Definition at line 147 of file `regex_error.h`.

5.637.3.2 `virtual const char* std::runtime_error::what () const throw () [virtual, inherited]`

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

5.638 `std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >` Class Template Reference 2949

Reimplemented from [std::exception](#).

The documentation for this class was generated from the following file:

- [regex_error.h](#)

5.638 `std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >` Class Template Reference

5.638.1 Detailed Description

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> class
std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >
```

An iterator adaptor that will provide repeated calls of `regex_search` over a range until no more matches remain.

Definition at line 2149 of file `regex.h`.

5.638.2 Constructor & Destructor Documentation

5.638.2.1 `template<typename _Bi_iter , typename _Ch_type = typename
iterator_traits<_Bi_iter>::value_type, typename _Rx_traits =
regex_traits<_Ch_type>> std::regex_iterator< _Bi_iter, _Ch_type,
_Rx_traits >::regex_iterator ()`

Provides a singular iterator, useful for indicating one-past-the-end of a range.

Todo

Implement this function.

Doc me! See doc/doxygen/TODO and <http://gcc.gnu.org/ml/libstdc++/2002-02/msg0000> for more.

5.638.2.2 `template<typename _Bi_iter , typename _Ch_type = typename
iterator_traits<_Bi_iter>::value_type, typename _Rx_traits =
regex_traits<_Ch_type>> std::regex_iterator< _Bi_iter, _Ch_type,
_Rx_traits >::regex_iterator (_Bi_iter __a, _Bi_iter __b, const
regex_type & __re, regex_constants::match_flag_type __m =
regex_constants::match_default)`

Constructs a `regex_iterator`...

Parameters

a [IN] The start of a text range to search.

b [IN] One-past-the-end of the text range to search.

re [IN] The regular expression to match.

m [IN] Policy flags for match rules.

Todo

Implement this function.

Doc me! See doc/doxygen/TODO and <http://gcc.gnu.org/ml/libstdc++/2002-02/msg0000> for more.

5.638.2.3 `template<typename _Bi_iter , typename _Ch_type = typename
iterator_traits<_Bi_iter>::value_type, typename _Rx_traits =
regex_traits<_Ch_type>> std::regex_iterator< _Bi_iter, _Ch_type,
_Rx_traits >::regex_iterator (const regex_iterator< _Bi_iter,
_Ch_type, _Rx_traits > & __rhs)`

Copy constructs a `regex_iterator`.

Todo

Implement this function.

Doc me! See doc/doxygen/TODO and <http://gcc.gnu.org/ml/libstdc++/2002-02/msg00003.html> for more.

5.638.3 Member Function Documentation

5.638.3.1 `template<typename _Bi_iter, typename _Ch_type = typename
iterator_traits<_Bi_iter>::value_type, typename _Rx_traits =
regex_traits<_Ch_type>> bool std::regex_iterator< _Bi_iter,
_Ch_type, _Rx_traits >::operator!=(const regex_iterator< _Bi_iter,
_Ch_type, _Rx_traits > & __rhs)`

Todo

Implement this function.

Doc me! See doc/doxygen/TODO and <http://gcc.gnu.org/ml/libstdc++/2002-02/msg00003.html> for more.

5.638.3.2 `template<typename _Bi_iter, typename _Ch_type = typename
iterator_traits<_Bi_iter>::value_type, typename _Rx_traits =
regex_traits<_Ch_type>> const value_type& std::regex_iterator<
_Bi_iter, _Ch_type, _Rx_traits >::operator*()`

Todo

Implement this function.

Doc me! See doc/doxygen/TODO and <http://gcc.gnu.org/ml/libstdc++/2002-02/msg00003.html> for more.

5.638.3.3 `template<typename _Bi_iter, typename _Ch_type = typename
iterator_traits<_Bi_iter>::value_type, typename _Rx_traits =
regex_traits<_Ch_type>> regex_iterator std::regex_iterator<
_Bi_iter, _Ch_type, _Rx_traits >::operator++(int)`

Todo

Implement this function.

Doc me! See doc/doxygen/TODO and <http://gcc.gnu.org/ml/libstdc++/2002-02/msg00003.html> for more.

5.638.3.4 `template<typename _Bi_iter , typename _Ch_type = typename
iterator_traits<_Bi_iter>::value_type, typename _Rx_traits =
regex_traits<_Ch_type>> regex_iterator& std::regex_iterator<
_Bi_iter, _Ch_type, _Rx_traits >::operator++ ()`

Todo

Implement this function.

Doc me! See doc/doxygen/TODO and <http://gcc.gnu.org/ml/libstdc++/2002-02/msg0000> for more.

5.638.3.5 `template<typename _Bi_iter , typename _Ch_type = typename
iterator_traits<_Bi_iter>::value_type, typename _Rx_traits =
regex_traits<_Ch_type>> const value_type* std::regex_iterator<
_Bi_iter, _Ch_type, _Rx_traits >::operator-> ()`

Todo

Implement this function.

Doc me! See doc/doxygen/TODO and <http://gcc.gnu.org/ml/libstdc++/2002-02/msg0000> for more.

5.638.3.6 `template<typename _Bi_iter , typename _Ch_type = typename
iterator_traits<_Bi_iter>::value_type, typename _Rx_traits =
regex_traits<_Ch_type>> regex_iterator& std::regex_iterator<
_Bi_iter, _Ch_type, _Rx_traits >::operator= (const regex_iterator<
_Bi_iter, _Ch_type, _Rx_traits > & __rhs)`

Todo

Implement this function.

Doc me! See doc/doxygen/TODO and <http://gcc.gnu.org/ml/libstdc++/2002-02/msg0000> for more.

5.638.3.7 `template<typename _Bi_iter , typename _Ch_type = typename
iterator_traits<_Bi_iter>::value_type, typename _Rx_traits =
regex_traits<_Ch_type>> bool std::regex_iterator< _Bi_iter,
_Ch_type, _Rx_traits >::operator== (const regex_iterator<
_Bi_iter, _Ch_type, _Rx_traits > & __rhs)`

Todo

Implement this function.

Doc me! See doc/doxygen/TODO and <http://gcc.gnu.org/ml/libstdc++/2002-02/msg0000> for more.

5.639.1 Detailed Description

```
template<typename _Bi_iter, typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> class
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >
```

Iterates over submatches in a range (or *splits* a text string).

The purpose of this iterator is to enumerate all, or all specified, matches of a regular expression within a text range. The dereferenced value of an iterator of this class is a [std::sub_match](#) object.

Definition at line 2264 of file `regex.h`.

5.639.2 Constructor & Destructor Documentation

5.639.2.1 `template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator ()`

Default constructs a `regex_token_iterator`.

Todo

Implement this function.

A default-constructed `regex_token_iterator` is a singular iterator that will compare equal to the one-past-the-end value for any iterator of the same type.

5.639.2.2 `template<typename _Bi_iter , typename _Ch_type = typename iterator_traits<_Bi_iter>::value_type, typename _Rx_traits = regex_traits<_Ch_type>> std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator (_Bi_iter __a, _Bi_iter __b, const regex_type & __re, int __submatch = 0, regex_constants::match_flag_type __m = regex_constants::match_default)`

Constructs a `regex_token_iterator`...

Parameters

a [IN] The start of the text to search.

b [IN] One-past-the-end of the text to search.

re [IN] The regular expression to search for.

submatch [IN] Which submatch to return. There are some special values for this parameter:

- -1 each enumerated subexpression does NOT match the regular expression (aka field splitting)
- 0 the entire string matching the subexpression is returned for each match within the text.
- >0 enumerates only the indicated subexpression from a match within the text.

m [IN] Policy flags for match rules.

Todo

Implement this function.

Doc me! See doc/doxygen/TODO and <http://gcc.gnu.org/ml/libstdc++/2002-02/msg00003.html> for more.

```
5.639.2.3 template<typename _Bi_iter, typename _Ch_type = typename
iterator_traits<_Bi_iter>::value_type, typename _Rx_traits =
regex_traits<_Ch_type>> std::regex_token_iterator<_Bi_iter,
_Ch_type, _Rx_traits>::regex_token_iterator ( _Bi_iter __a,
_Bi_iter __b, const regex_type & __re, const std::vector<int
> & __submatches, regex_constants::match_flag_type __m =
regex_constants::match_default )
```

Constructs a `regex_token_iterator`...

Parameters

a [IN] The start of the text to search.

b [IN] One-past-the-end of the text to search.

re [IN] The regular expression to search for.

submatches [IN] A list of subexpressions to return for each regular expression match within the text.

m [IN] Policy flags for match rules.

Todo

Implement this function.

Doc me! See doc/doxygen/TODO and <http://gcc.gnu.org/ml/libstdc++/2002-02/msg00003.html> for more.

```

5.639.2.4 template<typename _Bi_iter , typename _Ch_type =
typename iterator_traits<_Bi_iter>::value_type, typename
_Rx_traits = regex_traits<_Ch_type>> template<std::size_t
_Nm> std::regex_token_iterator< _Bi_iter, _Ch_type,
_Rx_traits >::regex_token_iterator ( _Bi_iter __a,
_Bi_iter __b, const regex_type & __re, const int(&)
__submatches[_Nm], regex_constants::match_flag_type __m =
regex_constants::match_default )

```

Constructs a `regex_token_iterator`...

Parameters

- a* [IN] The start of the text to search.
- b* [IN] One-past-the-end of the text to search.
- re* [IN] The regular expression to search for.
- submatches* [IN] A list of subexpressions to return for each regular expression match within the text.
- m* [IN] Policy flags for match rules.

Todo

Implement this function.

Doc me! See doc/doxygen/TODO and <http://gcc.gnu.org/ml/libstdc++/2002-02/msg0000> for more.

```

5.639.2.5 template<typename _Bi_iter , typename _Ch_type = typename
iterator_traits<_Bi_iter>::value_type, typename _Rx_traits
= regex_traits<_Ch_type>> std::regex_token_iterator<
_Bi_iter, _Ch_type, _Rx_traits >::regex_token_iterator ( const
regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits > & __rhs )

```

Copy constructs a `regex_token_iterator`.

Parameters

- rhs* [IN] A `regex_token_iterator` to copy.

Todo

Implement this function.

5.639.3 Member Function Documentation

5.639.3.1 `template<typename _Bi_iter, typename _Ch_type = typename
iterator_traits<_Bi_iter>::value_type, typename _Rx_traits =
regex_traits<_Ch_type>> bool std::regex_token_iterator< _Bi_iter,
_Ch_type, _Rx_traits >::operator!=(const regex_token_iterator<
_Bi_iter, _Ch_type, _Rx_traits > & __rhs)`

Compares a regex_token_iterator to another for inequality.

Todo

Implement this function.

5.639.3.2 `template<typename _Bi_iter, typename _Ch_type =
typename iterator_traits<_Bi_iter>::value_type, typename
_Rx_traits = regex_traits<_Ch_type>> const value_type&
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits
>::operator* ()`

Dereferences a regex_token_iterator.

Todo

Implement this function.

5.639.3.3 `template<typename _Bi_iter, typename _Ch_type =
typename iterator_traits<_Bi_iter>::value_type, typename
_Rx_traits = regex_traits<_Ch_type>> regex_token_iterator
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits
>::operator++ (int)`

Postincrements a regex_token_iterator.

Todo

Implement this function.

5.639.3.4 `template<typename _Bi_iter , typename _Ch_type =
typename iterator_traits<_Bi_iter>::value_type, typename
_Rx_traits = regex_traits<_Ch_type>> regex_token_iterator&
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits
>::operator++ ()`

Increments a `regex_token_iterator`.

Todo

Implement this function.

5.639.3.5 `template<typename _Bi_iter , typename _Ch_type =
typename iterator_traits<_Bi_iter>::value_type, typename
_Rx_traits = regex_traits<_Ch_type>> const value_type*
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits
>::operator-> ()`

Selects a `regex_token_iterator` member.

Todo

Implement this function.

5.639.3.6 `template<typename _Bi_iter , typename _Ch_type =
typename iterator_traits<_Bi_iter>::value_type, typename
_Rx_traits = regex_traits<_Ch_type>> regex_token_iterator&
std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits
>::operator= (const regex_token_iterator< _Bi_iter, _Ch_type,
_Rx_traits > & __rhs)`

Assigns a `regex_token_iterator` to another.

Parameters

rhs [IN] A `regex_token_iterator` to copy.

Todo

Implement this function.

```
5.639.3.7  template<typename _Bi_iter , typename _Ch_type = typename
            iterator_traits<_Bi_iter>::value_type, typename _Rx_traits =
            regex_traits<_Ch_type>> bool std::regex_token_iterator< _Bi_iter,
            _Ch_type, _Rx_traits >::operator==( const regex_token_iterator<
            _Bi_iter, _Ch_type, _Rx_traits > & __rhs )
```

Compares a `regex_token_iterator` to another for equality.

Todo

Implement this function.

5.640.1 Detailed Description

`template<typename _Ch_type> struct std::regex_traits< _Ch_type >`

Describes aspects of a regular expression. A regular expression traits class that satisfies the requirements of section [28.7].

The class `regex` is parameterized around a set of related types and functions used to complete the definition of its semantics. This class satisfies the requirements of such a traits class.

Definition at line 52 of file `regex.h`.

5.640.2 Constructor & Destructor Documentation

5.640.2.1 `template<typename _Ch_type > std::regex_traits< _Ch_type >::regex_traits () [inline]`

Constructs a default traits object.

Definition at line 64 of file `regex.h`.

5.640.3 Member Function Documentation

5.640.3.1 `template<typename _Ch_type > locale_type std::regex_traits< _Ch_type >::getloc () const [inline]`

Gets a copy of the current locale in use by the `regex_traits` object.

Definition at line 273 of file `regex.h`.

5.640.3.2 `template<typename _Ch_type > locale_type std::regex_traits<
_Ch_type >::imbue (locale_type __loc) [inline]`

Imbues the [regex_traits](#) object with a copy of a new locale.

Parameters

loc A locale.

Returns

a copy of the previous locale in use by the [regex_traits](#) object.

Note

Calling imbue with a different locale than the one currently in use invalidates all cached data held by *this.

Definition at line 262 of file regex.h.

References std::swap().

5.640.3.3 `template<typename _Ch_type > static std::size_t std::regex_traits<
_Ch_type >::length (const char_type * __p) [inline,
static]`

Gives the length of a C-style string starting at __p.

Parameters

__p a pointer to the start of a character sequence.

Returns

the number of characters between *__p and the first default-initialized value of type char_type. In other words, uses the C-string algorithm for determining the length of a sequence of characters.

Definition at line 78 of file regex.h.

References std::basic_string< _CharT, _Traits, _Alloc >::length().

5.640.3.4 `template<typename _Ch_type > template<typename _Fwd_iter >
char_class_type std::regex_traits< _Ch_type >::lookup_classname (
_Fwd_iter __first, _Fwd_iter __last, bool __icase = false) const
[inline]`

Maps one or more characters to a named character classification.

Parameters

first beginning of the character sequence.

last one-past-the-end of the character sequence.

icase ignores the case of the classification name.

Returns

an unspecified value that represents the character classification named by the character sequence designated by the iterator range `[first, last)`. If `icase` is true, the returned mask identifies the classification regardless of the case of the characters to be matched (for example, `[:lower:]` is the same as `[:alpha:]`), otherwise a case-dependant classification is returned. The value returned shall be independent of the case of the characters in the character sequence. If the name is not recognized then returns a value that compares equal to 0.

At least the following names (or their wide-character equivalent) are supported.

- `d`
- `w`
- `s`
- `alnum`
- `alpha`
- `blank`
- `cntrl`
- `digit`
- `graph`
- `lower`
- `print`
- `punct`
- `space`
- `upper`
- `xdigit`

Todo

Implement this function.

Definition at line 218 of file `regex.h`.

Referenced by `std::regex_traits<_Ch_type>::isctype()`.

5.640.3.5 `template<typename _Ch_type > template<typename _Fwd_iter >
string_type std::regex_traits< _Ch_type >::lookup_collatename (
_Fwd_iter __first, _Fwd_iter __last) const [inline]`

Gets a collation element by name.

Parameters

first beginning of the collation element name.

last one-past-the-end of the collation element name.

Returns

a sequence of one or more characters that represents the collating element consisting of the character sequence designated by the iterator range [first, last). Returns an empty string if the character sequence is not a valid collating element.

Todo

Implement this function.

Definition at line 175 of file regex.h.

5.640.3.6 `template<typename _Ch_type > template<typename _Fwd_iter >
string_type std::regex_traits< _Ch_type >::transform (_Fwd_iter
__first, _Fwd_iter __last) const [inline]`

Gets a sort key for a character sequence.

Parameters

first beginning of the character sequence.

last one-past-the-end of the character sequence.

Returns a sort key for the character sequence designated by the iterator range [F1, F2) such that if the character sequence [G1, G2) sorts before the character sequence [H1, H2) then `v.transform(G1, G2) < v.transform(H1, H2)`.

What this really does is provide a more efficient way to compare a string to multiple other strings in locales with fancy collation rules and equivalence classes.

Returns

a locale-specific sort key equivalent to the input range.

Exceptions

std::bad_cast if the current locale does not have a collate facet.

Definition at line 131 of file regex.h.

References `std::basic_string< _CharT, _Traits, _Alloc >::data()`, `std::basic_string< _CharT, _Traits, _Alloc >::size()`, `std::collate< _CharT >::transform()`, and `std::use_facet()`.

5.640.3.7 `template<typename _Ch_type > template<typename _Fwd_iter > string_type std::regex_traits< _Ch_type >::transform_primary (_Fwd_iter __first, _Fwd_iter __last) const [inline]`

Gets a sort key for a character sequence, independant of case.

Parameters

first beginning of the character sequence.

last one-past-the-end of the character sequence.

Effects: if `typeid(use_facet<collate<_Ch_type> >) == typeid(collate_byname<_Ch_type>)` and the form of the sort key returned by `collate_byname<_Ch_type>::transform(first, last)` is known and can be converted into a primary sort key then returns that key, otherwise returns an empty string.

Todo

Implement this function.

Definition at line 157 of file regex.h.

5.640.3.8 `template<typename _Ch_type > char_type std::regex_traits< _Ch_type >::translate (char_type __c) const [inline]`

Performs the identity translation.

Parameters

c A character to the locale-specific character set.

Returns

c.

Definition at line 89 of file regex.h.

5.640.3.9 `template<typename _Ch_type > char_type std::regex_traits< _Ch_type >::translate_nocase (char_type __c) const [inline]`

Translates a character into a case-insensitive equivalent.

Parameters

c A character to the locale-specific character set.

Returns

the locale-specific lower-case equivalent of *c*.

Exceptions

[*std::bad_cast*](#) if the imbued locale does not support the ctype facet.

Definition at line 102 of file `regex.h`.

References `std::tolower()`.

5.642.1 Detailed Description

template<typename _Iterator> class std::reverse_iterator< _Iterator >

Bidirectional and random access iterators have corresponding reverse iterator adaptors that iterate through the data structure in the opposite direction. They have the same signatures as the corresponding iterators. The fundamental relation between a reverse iterator and its corresponding iterator `i` is established by the identity:

```
&*(reverse_iterator(i)) == &(i - 1)
```

This mapping is dictated by the fact that while there is always a pointer past the end of an array, there might not be a valid pointer before the beginning of an array. [24.4.1]/1,2

Reverse iterators can be tricky and surprising at first. Their semantics make sense, however, and the trickiness is a side effect of the requirement that the iterators must be safe.

Definition at line 95 of file `stl_iterator.h`.

5.642.2 Member Typedef Documentation

5.642.2.1 **template<typename _Iterator> typedef __traits_difference_type std::reverse_iterator< _Iterator >::difference_type**

Distance between iterators is represented as this type.

Reimplemented from [std::iterator< iterator_traits< _Iterator >::iterator_category, iterator_traits< _Iterator >::value_type, iterator_traits< _Iterator >::difference_type, iterator_traits< _Iterator >::pointer, iterator_traits< _Iterator >::reference >](#).

Definition at line 109 of file `stl_iterator.h`.

5.642.2.2 **typedef iterator_traits< _Iterator >::iterator_category std::iterator< iterator_traits< _Iterator >::iterator_category, iterator_traits< _Iterator >::value_type, iterator_traits< _Iterator >::difference_type, iterator_traits< _Iterator >::pointer, iterator_traits< _Iterator >::reference >::iterator_category [inherited]**

One of the [tag types](#).

Definition at line 120 of file `stl_iterator_base_types.h`.

5.642.2.3 `template<typename _Iterator> typedef __traits_type::pointer
std::reverse_iterator< _Iterator >::pointer`

This type represents a pointer-to-value_type.

Reimplemented from `std::iterator< iterator_traits< _Iterator >::iterator_category,
iterator_traits< _Iterator >::value_type, iterator_traits< _Iterator >::difference_type,
iterator_traits< _Iterator >::pointer, iterator_traits< _Iterator >::reference >`.

Definition at line 110 of file `stl_iterator.h`.

5.642.2.4 `template<typename _Iterator> typedef __traits_type::reference
std::reverse_iterator< _Iterator >::reference`

This type represents a reference-to-value_type.

Reimplemented from `std::iterator< iterator_traits< _Iterator >::iterator_category,
iterator_traits< _Iterator >::value_type, iterator_traits< _Iterator >::difference_type,
iterator_traits< _Iterator >::pointer, iterator_traits< _Iterator >::reference >`.

Definition at line 111 of file `stl_iterator.h`.

5.642.2.5 `typedef iterator_traits< _Iterator >::value_type std::iterator<
iterator_traits< _Iterator >::iterator_category , iterator_traits<
_Iterator >::value_type , iterator_traits< _Iterator
>::difference_type , iterator_traits< _Iterator >::pointer
, iterator_traits< _Iterator >::reference >::value_type
[inherited]`

The type "pointed to" by the iterator.

Definition at line 122 of file `stl_iterator_base_types.h`.

5.642.3 Constructor & Destructor Documentation

5.642.3.1 `template<typename _Iterator> std::reverse_iterator< _Iterator
>::reverse_iterator () [inline]`

The default constructor default-initializes member `current`. If it is a pointer, that means it is zero-initialized.

Definition at line 119 of file `stl_iterator.h`.

5.642.3.2 `template<typename _Iterator> std::reverse_iterator< _Iterator
>::reverse_iterator (iterator_type __x) [inline, explicit]`

This iterator will move in the opposite direction that `x` does.

Definition at line 125 of file `stl_iterator.h`.

5.642.3.3 `template<typename _Iterator> std::reverse_iterator< _Iterator
>::reverse_iterator (const reverse_iterator< _Iterator > & __x)
[inline]`

The copy constructor is normal.

Definition at line 130 of file `stl_iterator.h`.

5.642.3.4 `template<typename _Iterator> template<typename _Iter >
std::reverse_iterator< _Iterator >::reverse_iterator (const
reverse_iterator< _Iter > & __x) [inline]`

A [reverse_iterator](#) across other types can be copied in the normal fashion.

Definition at line 138 of file `stl_iterator.h`.

5.642.4 Member Function Documentation

5.642.4.1 `template<typename _Iterator> iterator_type std::reverse_iterator<
_Iterator >::base () const [inline]`

Returns

`current`, the iterator used for underlying work.

Definition at line 145 of file `stl_iterator.h`.

5.643 std::runtime_error Class Reference

One of two subclasses of exception.

Inheritance diagram for std::runtime_error:

Public Member Functions

- `runtime_error` (const `string` &__arg)
- virtual const char * `what` () const throw ()

5.643.1 Detailed Description

One of two subclasses of exception. Runtime errors represent problems outside the scope of a program; they cannot be easily predicted and can generally only be caught as the program executes.

Definition at line 107 of file `stdexcept`.

5.643.2 Constructor & Destructor Documentation

5.643.2.1 `std::runtime_error::runtime_error (const string & __arg)`
[**explicit**]

Takes a character string describing the error.

5.643.3 Member Function Documentation

5.643.3.1 `virtual const char* std::runtime_error::what () const throw ()`
[**virtual**]

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

The documentation for this class was generated from the following file:

- [stdexcept](#)

5.644 std::seed_seq Class Reference

5.645.1 Detailed Description

`template<typename _Key, typename _Compare = std::less<_Key>, typename _Alloc = std::allocator<_Key>> class std::set< _Key, _Compare, _Alloc >`

A standard container made up of unique keys, which can be retrieved in logarithmic time. Meets the requirements of a [container](#), a [reversible container](#), and an [associative container](#) (using unique keys).

Sets support bidirectional iterators.

Parameters

Key Type of key objects.

Compare Comparison function object type, defaults to `less<Key>`.

Alloc Allocator type, defaults to `allocator<Key>`.

The private tree data is declared exactly the same way for set and multiset; the distinction is made entirely in how the tree functions are called (`*_unique` versus `*_equal`, same as the standard).

Definition at line 87 of file `stl_set.h`.

5.645.2 Member Typedef Documentation

5.645.2.1 `template<typename _Key, typename _Compare = std::less<_Key>,`

5.645.3 Constructor & Destructor Documentation

5.645.3.1 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> std::set< _Key,
_Compare, _Alloc >::set () [inline]`

Default constructor creates no elements.

Definition at line 136 of file stl_set.h.

5.645.3.2 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> std::set<_Key,
_Compare, _Alloc >::set (const _Compare & __comp, const
allocator_type & __a = allocator_type ()) [inline,
explicit]`

Creates a set with no elements.

Parameters

comp Comparator to use.

a An allocator object.

Definition at line 145 of file stl_set.h.

5.645.3.3 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> template<typename
_InputIterator > std::set<_Key, _Compare, _Alloc >::set (
_InputIterator __first, _InputIterator __last) [inline]`

Builds a set from a range.

Parameters

first An input iterator.

last An input iterator.

Create a set consisting of copies of the elements from [first,last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(first,last)).

Definition at line 159 of file stl_set.h.

5.645.3.4 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> template<typename
_InputIterator > std::set<_Key, _Compare, _Alloc >::set (
_InputIterator __first, _InputIterator __last, const _Compare
& __comp, const allocator_type & __a = allocator_type ())
[inline]`

Builds a set from a range.

Parameters

first An input iterator.

last An input iterator.

comp A comparison functor.

a An allocator object.

Create a set consisting of copies of the elements from [first,last). This is linear in N if the range is already sorted, and NlogN otherwise (where N is distance(first,last)).

Definition at line 175 of file stl_set.h.

```
5.645.3.5  template<typename _Key, typename _Compare = std::less<_Key>,
              typename _Alloc = std::allocator<_Key>> std::set< _Key,
              _Compare, _Alloc >::set ( const set< _Key, _Compare, _Alloc > &
              __x ) [inline]
```

Set copy constructor.

Parameters

x A set of identical element and allocator types.

The newly-created set uses a copy of the allocation object used by *x*.

Definition at line 188 of file stl_set.h.

```
5.645.3.6  template<typename _Key, typename _Compare = std::less<_Key>,
              typename _Alloc = std::allocator<_Key>> std::set< _Key,
              _Compare, _Alloc >::set ( set< _Key, _Compare, _Alloc > && __x
              ) [inline]
```

Set move constructor

Parameters

x A set of identical element and allocator types.

The newly-created set contains the exact contents of *x*. The contents of *x* are a valid, but unspecified set.

Definition at line 199 of file stl_set.h.

```
5.645.3.7  template<typename _Key, typename _Compare = std::less<_Key>,
              typename _Alloc = std::allocator<_Key>> std::set< _Key,
              _Compare, _Alloc >::set ( initializer_list< value_type > __l, const
              _Compare & __comp = _Compare(), const allocator_type & __a =
              allocator_type() ) [inline]
```

Builds a set from an [initializer_list](#).

Parameters

l An [initializer_list](#).

comp A comparison functor.

a An allocator object.

Create a set consisting of copies of the elements in the list. This is linear in N if the list is already sorted, and NlogN otherwise (where N is *l.size()*).

Definition at line 212 of file `stl_set.h`.

5.645.4 Member Function Documentation

5.645.4.1 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> iterator std::set<_Key,
_Compare, _Alloc>::begin () const [inline]`

Returns a read-only (constant) iterator that points to the first element in the set. Iteration is done in ascending order according to the keys.

Definition at line 292 of file `stl_set.h`.

5.645.4.2 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> iterator std::set<_Key,
_Compare, _Alloc>::cbegin () const [inline]`

Returns a read-only (constant) iterator that points to the first element in the set. Iteration is done in ascending order according to the keys.

Definition at line 329 of file `stl_set.h`.

5.645.4.3 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> iterator std::set<_Key,
_Compare, _Alloc>::cend () const [inline]`

Returns a read-only (constant) iterator that points one past the last element in the set. Iteration is done in ascending order according to the keys.

Definition at line 338 of file `stl_set.h`.

5.645.4.4 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> void std::set< _Key,
_Compare, _Alloc >::clear () [inline]`

Erases all elements in a set. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 552 of file stl_set.h.

5.645.4.5 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> size_type std::set<
_Key, _Compare, _Alloc >::count (const key_type & __x) const
[inline]`

Finds the number of elements.

Parameters

x Element to located.

Returns

Number of elements with specified key.

This function only makes sense for multisets; for set the result will either be 0 (not present) or 1 (present).

Definition at line 566 of file stl_set.h.

5.645.4.6 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> reverse_iterator std::set<
_Key, _Compare, _Alloc >::crbegin () const [inline]`

Returns a read-only (constant) iterator that points to the last element in the set. Iteration is done in descending order according to the keys.

Definition at line 347 of file stl_set.h.

5.645.4.7 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> reverse_iterator std::set<
_Key, _Compare, _Alloc >::crend () const [inline]`

Returns a read-only (constant) reverse iterator that points to the last pair in the set. Iteration is done in descending order according to the keys.

Definition at line 356 of file stl_set.h.

5.645.4.8 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> bool std::set<_Key,
_Compare, _Alloc>::empty () const [inline]`

Returns true if the set is empty.

Definition at line 362 of file `stl_set.h`.

5.645.4.9 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> iterator std::set<_Key,
_Compare, _Alloc>::end () const [inline]`

Returns a read-only (constant) iterator that points one past the last element in the set. Iteration is done in ascending order according to the keys.

Definition at line 301 of file `stl_set.h`.

5.645.4.10 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> std::pair<iterator,
iterator> std::set<_Key, _Compare, _Alloc>::equal_range (const
key_type & __x) [inline]`

Finds a subsequence matching given key.

Parameters

x Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
              c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

Definition at line 646 of file `stl_set.h`.

```
5.645.4.11 template<typename _Key, typename _Compare =
std::less<_Key>, typename _Alloc = std::allocator<_Key>>
std::pair<const_iterator, const_iterator> std::set< _Key,
_Compare, _Alloc >::equal_range ( const key_type & __x ) const
[inline]
```

Finds a subsequence matching given key.

Parameters

x Key to be located.

Returns

Pair of iterators that possibly points to the subsequence matching given key.

This function is equivalent to

```
std::make_pair(c.lower_bound(val),
               c.upper_bound(val))
```

(but is faster than making the calls separately).

This function probably only makes sense for multisets.

Definition at line 650 of file stl_set.h.

```
5.645.4.12 template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> iterator std::set< _Key,
_Compare, _Alloc >::erase ( iterator __position ) [inline]
```

Erases an element from a set.

Parameters

position An iterator pointing to the element to be erased.

Returns

An iterator pointing to the element immediately following *position* prior to the element being erased. If no such element exists, [end\(\)](#) is returned.

This function erases an element, pointed to by the given iterator, from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 478 of file stl_set.h.

5.645.4.13 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> size_type std::set<_Key,
_Compare, _Alloc >::erase (const key_type & __x) [inline]`

Erases elements according to the provided key.

Parameters

x Key of element to be erased.

Returns

The number of elements erased.

This function erases all the elements located by the given key from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 507 of file `stl_set.h`.

5.645.4.14 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> iterator std::set<_Key,
_Compare, _Alloc >::erase (iterator __first, iterator __last)
[inline]`

Erases a `[first,last)` range of elements from a set.

Parameters

first Iterator pointing to the start of the range to be erased.

last Iterator pointing to the end of the range to be erased.

Returns

The iterator *last*.

This function erases a sequence of elements from a set. Note that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 526 of file `stl_set.h`.

5.645.4.15 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> iterator std::set<_Key,
_Compare, _Alloc >::find (const key_type & __x) [inline]`

Tries to locate an element in a set.

Parameters

x Element to be located.

Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 584 of file `stl_set.h`.

```
5.645.4.16 template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> const_iterator std::set<
_Key, _Compare, _Alloc >::find ( const key_type & __x ) const
[inline]
```

Tries to locate an element in a set.

Parameters

x Element to be located.

Returns

Iterator pointing to sought-after element, or `end()` if not found.

This function takes a key and tries to locate the element with which the key matches. If successful the function returns an iterator pointing to the sought after element. If unsuccessful it returns the past-the-end (`end()`) iterator.

Definition at line 588 of file `stl_set.h`.

```
5.645.4.17 template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> allocator_type std::set<
_Key, _Compare, _Alloc >::get_allocator ( ) const [inline]
```

Returns the allocator object with which the set was constructed.

Definition at line 283 of file `stl_set.h`.

```
5.645.4.18 template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> std::pair<iterator,
bool> std::set< _Key, _Compare, _Alloc >::insert ( const
value_type & __x ) [inline]
```

Attempts to insert an element into the set.

Parameters

x Element to be inserted.

Returns

A pair, of which the first element is an iterator that points to the possibly inserted element, and the second is a bool that is true if the element was actually inserted.

This function attempts to insert an element into the set. A set relies on unique keys and thus an element is only inserted if it is not already present in the set.

Insertion requires logarithmic time.

Definition at line 405 of file `stl_set.h`.

5.645.4.19 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> iterator std::set<_Key,
_Compare, _Alloc>::insert (iterator __position, const value_type
& __x) [inline]`

Attempts to insert an element into the set.

Parameters

position An iterator that serves as a hint as to where the element should be inserted.

x Element to be inserted.

Returns

An iterator that points to the element with key of *x* (may or may not be the element passed in).

This function is not concerned about whether the insertion took place, and thus does not return a boolean like the single-argument `insert()` does. Note that the first parameter is only a hint and can potentially improve the performance of the insertion process. A bad hint would cause no gains in efficiency.

For more on *hinting*, see: <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt07ch17>

Insertion requires logarithmic time (if the hint is not taken).

Definition at line 432 of file `stl_set.h`.

5.645.4.20 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> template<typename
_InputIterator > void std::set< _Key, _Compare, _Alloc >::insert (
_InputIterator __first, _InputIterator __last) [inline]`

A template function that attempts to insert a range of elements.

Parameters

first Iterator pointing to the start of the range to be inserted.

last Iterator pointing to the end of the range.

Complexity similar to that of the range constructor.

Definition at line 446 of file stl_set.h.

5.645.4.21 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> void std::set< _Key,
_Compare, _Alloc >::insert (initializer_list< value_type > __l)
[inline]`

Attempts to insert a list of elements into the set.

Parameters

list A std::initializer_list<value_type> of elements to be inserted.

Complexity similar to that of the range constructor.

Definition at line 458 of file stl_set.h.

Referenced by std::set< _StateIdT >::insert().

5.645.4.22 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> key_compare std::set<
_Key, _Compare, _Alloc >::key_comp () const [inline]`

Returns the comparison object with which the set was constructed.

Definition at line 275 of file stl_set.h.

5.645.4.23 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> iterator std::set< _Key,
_Compare, _Alloc >::lower_bound (const key_type & __x)
[inline]`

Finds the beginning of a subsequence matching given key.

Parameters

x Key to be located.

Returns

Iterator pointing to first element equal to or greater than key, or [end\(\)](#).

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or [end\(\)](#) if no such element exists.

Definition at line 605 of file `stl_set.h`.

```
5.645.4.24  template<typename _Key, typename _Compare = std::less<_Key>,
              typename _Alloc = std::allocator<_Key>>> const_iterator std::set<
              _Key, _Compare, _Alloc >::lower_bound ( const key_type & __x )
              const [inline]
```

Finds the beginning of a subsequence matching given key.

Parameters

x Key to be located.

Returns

Iterator pointing to first element equal to or greater than key, or [end\(\)](#).

This function returns the first element of a subsequence of elements that matches the given key. If unsuccessful it returns an iterator pointing to the first element that has a greater value than given key or [end\(\)](#) if no such element exists.

Definition at line 609 of file `stl_set.h`.

```
5.645.4.25  template<typename _Key, typename _Compare = std::less<_Key>,
              typename _Alloc = std::allocator<_Key>>> size_type std::set<
              _Key, _Compare, _Alloc >::max_size ( ) const [inline]
```

Returns the maximum size of the set.

Definition at line 372 of file `stl_set.h`.

5.645.4.26 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> set& std::set< _Key,
_Compare, _Alloc >::operator= (set< _Key, _Compare, _Alloc >
&& __x) [inline]`

Set move assignment operator.

Parameters

x A set of identical element and allocator types.

The contents of *x* are moved into this set (without copying). *x* is a valid, but unspecified set.

Definition at line 242 of file stl_set.h.

5.645.4.27 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> set& std::set< _Key,
_Compare, _Alloc >::operator= (initializer_list< value_type > __l
) [inline]`

Set list assignment operator.

Parameters

l An [initializer_list](#).

This function fills a set with copies of the elements in the initializer list *l*.

Note that the assignment completely changes the set and that the resulting set's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 263 of file stl_set.h.

5.645.4.28 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> set& std::set< _Key,
_Compare, _Alloc >::operator= (const set< _Key, _Compare,
_Alloc > & __x) [inline]`

Set assignment operator.

Parameters

x A set of identical element and allocator types.

All the elements of *x* are copied, but unlike the copy constructor, the allocator object is not copied.

Definition at line 227 of file stl_set.h.

5.645.4.29 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> reverse_iterator
std::set<_Key, _Compare, _Alloc>::rbegin () const [inline]`

Returns a read-only (constant) iterator that points to the last element in the set. Iteration is done in descending order according to the keys.

Definition at line 310 of file `stl_set.h`.

5.645.4.30 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> reverse_iterator
std::set<_Key, _Compare, _Alloc>::rend () const [inline]`

Returns a read-only (constant) reverse iterator that points to the last pair in the set. Iteration is done in descending order according to the keys.

Definition at line 319 of file `stl_set.h`.

5.645.4.31 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> size_type std::set<
_Key, _Compare, _Alloc>::size () const [inline]`

Returns the size of the set.

Definition at line 367 of file `stl_set.h`.

5.645.4.32 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> void std::set<_Key,
_Compare, _Alloc>::swap (set<_Key, _Compare, _Alloc> & __x
) [inline]`

Swaps data with another set.

Parameters

x A set of the same element and allocator types.

This exchanges the elements between two sets in constant time. (It is only swapping a pointer, an integer, and an instance of the `Compare` type (which itself is often stateless and empty), so it should be quite fast.) Note that the global [std::swap\(\)](#) function is specialized such that `std::swap(s1,s2)` will feed to this function.

Definition at line 387 of file `stl_set.h`.

Referenced by `std::swap()`.

5.645.4.33 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> iterator std::set<_Key,
_Compare, _Alloc >::upper_bound (const key_type & __x)
[inline]`

Finds the end of a subsequence matching given key.

Parameters

`x` Key to be located.

Returns

Iterator pointing to the first element greater than key, or `end()`.

Definition at line 621 of file `stl_set.h`.

5.645.4.34 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> const_iterator std::set<
_Key, _Compare, _Alloc >::upper_bound (const key_type & __x)
const [inline]`

Finds the end of a subsequence matching given key.

Parameters

`x` Key to be located.

Returns

Iterator pointing to the first element greater than key, or `end()`.

Definition at line 625 of file `stl_set.h`.

5.645.4.35 `template<typename _Key, typename _Compare = std::less<_Key>,
typename _Alloc = std::allocator<_Key>> value_compare std::set<
_Key, _Compare, _Alloc >::value_comp () const [inline]`

Returns the comparison object with which the set was constructed.

Definition at line 279 of file `stl_set.h`.

5.649.1 Detailed Description

`template<typename _Tp> class std::shared_ptr< _Tp >`

A smart pointer with reference-counted copy semantics. The object pointed to is deleted when the last `shared_ptr` pointing to it is destroyed or reset.

Definition at line 91 of file `shared_ptr.h`.

5.649.2 Constructor & Destructor Documentation

5.649.2.1 `template<typename _Tp> std::shared_ptr< _Tp >::shared_ptr ()`
`[inline]`

Construct an empty `shared_ptr`.

Postcondition

`use_count()==0 && get()==0`

Definition at line 98 of file shared_ptr.h.

5.649.2.2 `template<typename _Tp> template<typename _Tp1 >
std::shared_ptr< _Tp >::shared_ptr (_Tp1 * __p) [inline,
explicit]`

Construct a shared_ptr that owns the pointer __p.

Parameters

__p A pointer that is convertible to element_type*.

Postcondition

`use_count() == 1 && get() == __p`

Exceptions

std::bad_alloc, in which case `delete __p` is called.

Definition at line 107 of file shared_ptr.h.

5.649.2.3 `template<typename _Tp> template<typename _Tp1 , typename
_Deleter > std::shared_ptr< _Tp >::shared_ptr (_Tp1 * __p,
_Deleter __d) [inline]`

Construct a shared_ptr that owns the pointer __p and the deleter __d.

Parameters

__p A pointer.

__d A deleter.

Postcondition

`use_count() == 1 && get() == __p`

Exceptions

std::bad_alloc, in which case `__d(__p)` is called.

Requirements: _Deleter's copy constructor and destructor must not throw

__shared_ptr will release __p by calling __d(__p)

Definition at line 123 of file shared_ptr.h.

5.649.2.4 `template<typename _Tp> template<typename _Deleter >
std::shared_ptr< _Tp >::shared_ptr (nullptr_t __p, _Deleter __d
) [inline]`

Construct a shared_ptr that owns a null pointer and the deleter __d.

Parameters

__p A null pointer constant.

__d A deleter.

Postcondition

use_count() == 1 && get() == __p

Exceptions

std::bad_alloc, in which case __d(__p) is called.

Requirements: _Deleter's copy constructor and destructor must not throw

The last owner will call __d(__p)

Definition at line 139 of file shared_ptr.h.

5.649.2.5 `template<typename _Tp> template<typename _Tp1 , typename
_Deleter , typename _Alloc > std::shared_ptr< _Tp >::shared_ptr (
_Tp1 * __p, _Deleter __d, const _Alloc & __a) [inline]`

Construct a shared_ptr that owns the pointer __p and the deleter __d.

Parameters

__p A pointer.

__d A deleter.

__a An allocator.

Postcondition

use_count() == 1 && get() == __p

Exceptions

std::bad_alloc, in which case __d(__p) is called.

Requirements: _Deleter's copy constructor and destructor must not throw _Alloc's copy constructor and destructor must not throw.

__shared_ptr will release __p by calling __d(__p)

Definition at line 158 of file shared_ptr.h.

5.649.2.6 `template<typename _Tp> template<typename _Deleter, typename
_Alloc> std::shared_ptr<_Tp>::shared_ptr (nullptr_t __p,
_Deleter __d, const _Alloc & __a) [inline]`

Construct a shared_ptr that owns a null pointer and the deleter __d.

Parameters

__p A null pointer constant.

__d A deleter.

__a An allocator.

Postcondition

use_count() == 1 && get() == __p

Exceptions

[std::bad_alloc](#), in which case __d(__p) is called.

Requirements: _Deleter's copy constructor and destructor must not throw _Alloc's copy constructor and destructor must not throw.

The last owner will call __d(__p)

Definition at line 177 of file shared_ptr.h.

5.649.2.7 `template<typename _Tp> template<typename _Tp1>
std::shared_ptr<_Tp>::shared_ptr (const shared_ptr<_Tp1> &
__r, _Tp* __p) [inline]`

Constructs a shared_ptr instance that stores __p and shares ownership with __r.

Parameters

__r A shared_ptr.

__p A pointer that will remain valid while *__r is valid.

Postcondition

get() == __p && use_count() == __r.use_count()

This can be used to construct a [shared_ptr](#) to a sub-object of an object managed by an existing [shared_ptr](#).

```
shared_ptr< pair<int,int> > pii(new pair<int,int>());
shared_ptr<int> pi(pii, &pii->first);
assert(pii.use_count() == 2);
```

Definition at line 199 of file shared_ptr.h.

5.649.2.8 `template<typename _Tp> template<typename _Tp1, typename
= typename std::enable_if<std::is_convertible<_Tp1*,
_Tp*>::value>::type> std::shared_ptr<_Tp>::shared_ptr (const
shared_ptr<_Tp1> & __r) [inline]`

If `__r` is empty, constructs an empty `shared_ptr`; otherwise construct a `shared_ptr` that shares ownership with `__r`.

Parameters

`__r` A `shared_ptr`.

Postcondition

`get() == __r.get() && use_count() == __r.use_count()`

Definition at line 211 of file `shared_ptr.h`.

5.649.2.9 `template<typename _Tp> std::shared_ptr<_Tp>::shared_ptr (
shared_ptr<_Tp> && __r) [inline]`

Move-constructs a `shared_ptr` instance from `__r`.

Parameters

`__r` A `shared_ptr` rvalue.

Postcondition

*this contains the old value of `__r`, `__r` is empty.

Definition at line 219 of file `shared_ptr.h`.

5.649.2.10 `template<typename _Tp> template<typename _Tp1, typename
= typename std::enable_if<std::is_convertible<_Tp1*,
_Tp*>::value>::type> std::shared_ptr<_Tp>::shared_ptr (
shared_ptr<_Tp1> && __r) [inline]`

Move-constructs a `shared_ptr` instance from `__r`.

Parameters

`__r` A `shared_ptr` rvalue.

Postcondition

*this contains the old value of `__r`, `__r` is empty.

Definition at line 229 of file `shared_ptr.h`.

5.649.2.11 `template<typename _Tp> template<typename _Tp1 >
std::shared_ptr<_Tp>::shared_ptr (const weak_ptr<_Tp1> &
__r) [inline, explicit]`

Constructs a `shared_ptr` that shares ownership with `__r` and stores a copy of the pointer stored in `__r`.

Parameters

`__r` A [weak_ptr](#).

Postcondition

`use_count() == __r.use_count()`

Exceptions

bad_weak_ptr when `__r.expired()`, in which case the constructor has no effect.

Definition at line 241 of file `shared_ptr.h`.

5.649.2.12 `template<typename _Tp> std::shared_ptr<_Tp>::shared_ptr (
nullptr_t __p) [inline]`

Construct an empty `shared_ptr`.

Parameters

`__p` A null pointer constant.

Postcondition

`use_count() == 0 && get() == nullptr`

Definition at line 259 of file `shared_ptr.h`.

5.649.3 Friends And Related Function Documentation

5.649.3.1 `template<typename _Tp> template<typename _Tp1 , typename
_Alloc , typename... _Args> shared_ptr<_Tp1> allocate_shared (
_Alloc __a, _Args &&... __args) [friend]`

Create an object that is owned by a [shared_ptr](#).

Parameters

`__a` An allocator.

`__args` Arguments for the `_Tp` object's constructor.

Returns

A [shared_ptr](#) that owns the newly created object.

Exceptions

An exception thrown from `_Alloc::allocate` or from the constructor of `_Tp`.

A copy of `__a` will be used to allocate memory for the [shared_ptr](#) and the new object.

Definition at line 520 of file `shared_ptr.h`.

5.650.1 Detailed Description

template<typename _RandomNumberEngine, size_t __k> class std::shuffle_order_engine< _RandomNumberEngine, __k >

Produces random numbers by combining random numbers from some base engine to produce random numbers with a specifies number of bits __w.

Definition at line 1237 of file random.h.

5.650.2 Member Typedef Documentation

**5.650.2.1 template<typename _RandomNumberEngine, size_t __k> typedef
_RandomNumberEngine::result_type std::shuffle_order_engine<
_RandomNumberEngine, __k >::result_type**

The type of the generated random value.

Definition at line 1244 of file random.h.

5.650.3 Constructor & Destructor Documentation

5.650.3.1 `template<typename _RandomNumberEngine, size_t __k>
std::shuffle_order_engine< _RandomNumberEngine, __k
>::shuffle_order_engine () [inline]`

Constructs a default shuffle_order_engine engine.

The underlying engine is default constructed as well.

Definition at line 1253 of file random.h.

5.650.3.2 `template<typename _RandomNumberEngine, size_t __k>
std::shuffle_order_engine< _RandomNumberEngine, __k
>::shuffle_order_engine (const _RandomNumberEngine & __rne)
[inline, explicit]`

Copy constructs a shuffle_order_engine engine.

Copies an existing base class random number generator.

Parameters

rng An existing (base class) engine object.

Definition at line 1264 of file random.h.

5.650.3.3 `template<typename _RandomNumberEngine, size_t __k>
std::shuffle_order_engine< _RandomNumberEngine, __k
>::shuffle_order_engine (_RandomNumberEngine && __rne)
[inline, explicit]`

Move constructs a shuffle_order_engine engine.

Copies an existing base class random number generator.

Parameters

rng An existing (base class) engine object.

Definition at line 1275 of file random.h.

5.650.3.4 `template<typename _RandomNumberEngine, size_t __k>
std::shuffle_order_engine< _RandomNumberEngine, __k
>::shuffle_order_engine (result_type __s) [inline,
explicit]`

Seed constructs a shuffle_order_engine engine.

Constructs the underlying generator engine seeded with __s.

Parameters

__s A seed value for the base class engine.

Definition at line 1286 of file random.h.

```
5.650.3.5  template<typename _RandomNumberEngine, size_t  
            __k> template<typename _Sseq , typename = typename  
            std::enable_if<!std::is_same<_Sseq, shuffle_order_engine>::value  
            && !std::is_same<_Sseq, _RandomNumberEngine>::value>  
            ::type> std::shuffle_order_engine< _RandomNumberEngine, __k  
            >::shuffle_order_engine( _Sseq & __q ) [inline, explicit]
```

Generator construct a shuffle_order_engine engine.

Parameters

__q A seed sequence.

Definition at line 1300 of file random.h.

5.650.4 Member Function Documentation

```
5.650.4.1  template<typename _RandomNumberEngine, size_t __k>  
            const _RandomNumberEngine& std::shuffle_order_engine<  
            _RandomNumberEngine, __k >::base( ) const [inline]
```

Gets a const reference to the underlying generator engine object.

Definition at line 1343 of file random.h.

```
5.650.4.2  template<typename _RandomNumberEngine, size_t __k> void  
            std::shuffle_order_engine< _RandomNumberEngine, __k >::discard  
            ( unsigned long long __z ) [inline]
```

Discard a sequence of random numbers.

Todo

Look for a faster way to do discard.

Definition at line 1370 of file random.h.

5.650.4.3 `template<typename _RandomNumberEngine, size_t __k>
result_type std::shuffle_order_engine< _RandomNumberEngine, __k
>::max () const [inline]`

Gets the maximum value in the generated random number range.

Todo

This should be constexpr.

Definition at line 1361 of file random.h.

5.650.4.4 `template<typename _RandomNumberEngine, size_t __k>
result_type std::shuffle_order_engine< _RandomNumberEngine, __k
>::min () const [inline]`

Gets the minimum value in the generated random number range.

Todo

This should be constexpr.

Definition at line 1352 of file random.h.

5.650.4.5 `template<typename _RandomNumberEngine , size_t __k>
shuffle_order_engine< _RandomNumberEngine, __k >::result_type
std::shuffle_order_engine< _RandomNumberEngine, __k
>::operator() ()`

Gets the next value in the generated random number sequence.

Definition at line 770 of file random.tcc.

5.650.4.6 `template<typename _RandomNumberEngine, size_t __k>
template<typename _Sseq > void std::shuffle_order_engine<
_RandomNumberEngine, __k >::seed (_Sseq & __q) [inline]`

Reseeds the shuffle_order_engine object with the given seed sequence.

Parameters

`__q` A seed generator function.

Definition at line 1333 of file random.h.

5.650.4.7 `template<typename _RandomNumberEngine, size_t __k> void
std::shuffle_order_engine<_RandomNumberEngine, __k>::seed (
result_type __s) [inline]`

Reseeds the `shuffle_order_engine` object with the default seed for the underlying base class generator engine.

Definition at line 1320 of file `random.h`.

5.650.4.8 `template<typename _RandomNumberEngine, size_t __k> void
std::shuffle_order_engine<_RandomNumberEngine, __k>::seed (
) [inline]`

Reseeds the `shuffle_order_engine` object with the default seed for the underlying base class generator engine.

Definition at line 1309 of file `random.h`.

5.650.5 Friends And Related Function Documentation

5.650.5.1 `template<typename _RandomNumberEngine, size_t __k>
template<typename _RandomNumberEngine1, size_t __k1,
typename _CharT, typename _Traits > std::basic_ostream<_CharT,
_Traits>& operator<< (std::basic_ostream<_CharT, _Traits> & ,
const std::shuffle_order_engine<_RandomNumberEngine1, __k1> &) [friend]`

Inserts the current state of a `shuffle_order_engine` random number generator engine `__x` into the output stream `__os`.

Parameters

`__os` An output stream.

`__x` A `shuffle_order_engine` random number generator engine.

Returns

The output stream with the state of `__x` inserted or in an error state.

5.650.5.2 `template<typename _RandomNumberEngine, size_t __k> bool
operator==(const shuffle_order_engine< _RandomNumberEngine,
__k > & __lhs, const shuffle_order_engine<
_RandomNumberEngine, __k > & __rhs) [friend]`

Compares two `shuffle_order_engine` random number generator objects of the same type for equality.

Parameters

`__lhs` A `shuffle_order_engine` random number generator object.

`__rhs` Another `shuffle_order_engine` random number generator object.

Returns

true if the infinite sequences of generated values would be equal, false otherwise.

Definition at line 1394 of file `random.h`.

5.650.5.3 `template<typename _RandomNumberEngine, size_t __k>
template<typename _RandomNumberEngine1, size_t __k1,
typename _CharT, typename _Traits > std::basic_istream<_CharT,
_Traits>& operator>> (std::basic_istream<_CharT, _Traits > & ,
std::shuffle_order_engine< _RandomNumberEngine1, __k1 > &)
[friend]`

Extracts the current state of a `% subtract_with_carry_engine` random number generator engine `__x` from the input stream `__is`.

Parameters

`__is` An input stream.

`__x` A `shuffle_order_engine` random number generator engine.

Returns

The input stream with the state of `__x` extracted or in an error state.

5.651 std::slice Class Reference

Class defining one-dimensional subset of an array.

Public Member Functions

- [slice](#) ()
- [slice](#) (size_t, size_t, size_t)
- size_t [size](#) () const
- size_t [start](#) () const
- size_t [stride](#) () const

5.651.1 Detailed Description

Class defining one-dimensional subset of an array. The slice class represents a one-dimensional subset of an array, specified by three parameters: start offset, size, and stride. The start offset is the index of the first element of the array that is part of the subset. The size is the total number of elements in the subset. Stride is the distance between each successive array element to include in the subset.

For example, with an array of size 10, and a slice with offset 1, size 3 and stride 2, the subset consists of array elements 1, 3, and 5.

Definition at line 58 of file `slice_array.h`.

The documentation for this class was generated from the following file:

- [slice_array.h](#)

5.652 `std::slice_array< _Tp >` Class Template Reference

Reference to one-dimensional subset of an array.

Public Types

5.652.1 Detailed Description

`template<typename _Tp> class std::slice_array< _Tp >`

Reference to one-dimensional subset of an array. A [slice_array](#) is a reference to the actual elements of an array specified by a slice. The way to get a [slice_array](#) is to call

operator[](slice) on a valarray. The returned [slice_array](#) then permits carrying operations out on the referenced subset of elements in the original valarray. For example, operator+=(valarray) will add values to the subset of elements in the underlying valarray this [slice_array](#) refers to.

Parameters

Tp Element type.

Definition at line 122 of file slice_array.h.

5.652.2 Member Function Documentation

5.652.2.1 `template<typename _Tp> void std::slice_array< _Tp >::operator%=(const valarray< _Tp > &) const`

Modulo slice elements by corresponding elements of *v*.

5.652.2.2 `template<typename _Tp> void std::slice_array< _Tp >::operator&=(const valarray< _Tp > &) const`

Logical and slice elements with corresponding elements of *v*.

5.652.2.3 `template<typename _Tp> void std::slice_array< _Tp >::operator*=(const valarray< _Tp > &) const`

Multiply slice elements by corresponding elements of *v*.

5.652.2.4 `template<typename _Tp> void std::slice_array< _Tp >::operator+=(const valarray< _Tp > &) const`

Add corresponding elements of *v* to slice elements.

5.652.2.5 `template<typename _Tp> void std::slice_array< _Tp >::operator-=(const valarray< _Tp > &) const`

Subtract corresponding elements of *v* from slice elements.

5.652.2.6 `template<typename _Tp> void std::slice_array< _Tp >::operator/=(const valarray< _Tp > &) const`

Divide slice elements by corresponding elements of *v*.

5.652.2.7 `template<typename _Tp> void std::slice_array< _Tp
>::operator<<= (const valarray< _Tp > &) const`

Left shift slice elements by corresponding elements of *v*.

5.652.2.8 `template<typename _Tp> void std::slice_array< _Tp
>::operator>>= (const valarray< _Tp > &) const`

Right shift slice elements by corresponding elements of *v*.

5.652.2.9 `template<typename _Tp> void std::slice_array< _Tp >::operator^=
(const valarray< _Tp > &) const`

Logical xor slice elements with corresponding elements of *v*.

5.652.2.10 `template<typename _Tp> void std::slice_array< _Tp
>::operator|= (const valarray< _Tp > &) const`

Logical or slice elements with corresponding elements of *v*.

5.653.1 Detailed Description

`template<typename _Tp, typename _Sequence = deque<_Tp>> class std::stack< _Tp, _Sequence >`

A standard container giving FILO behavior. Meets many of the requirements of a [container](#), but does not define anything to do with iterators. Very few of the other standard container interfaces are defined.

This is not a true container, but an *adaptor*. It holds another container, and provides a wrapper interface to that container. The wrapper is what enforces strict first-in-last-out stack behavior.

The second template parameter defines the type of the underlying sequence/container. It defaults to [std::deque](#), but it can be any type that supports `back`, `push_back`, and `pop_front`, such as [std::list](#), [std::vector](#), or an appropriate user-defined type.

Members not found in *normal* containers are `container_type`, which is a typedef for the second Sequence parameter, and `push`, `pop`, and `top`, which are standard stack/FILO operations.

Definition at line 92 of file `stl_stack.h`.

5.653.2 Constructor & Destructor Documentation

5.653.2.1 `template<typename _Tp, typename _Sequence = deque<_Tp>>
std::stack< _Tp, _Sequence >::stack (const _Sequence & __c)
[inline, explicit]`

Default constructor creates no elements.

Definition at line 130 of file `stl_stack.h`.

5.653.3 Member Function Documentation

5.653.3.1 `template<typename _Tp, typename _Sequence = deque<_Tp>>
bool std::stack< _Tp, _Sequence >::empty () const [inline]`

Returns true if the stack is empty.

Definition at line 142 of file stl_stack.h.

5.653.3.2 `template<typename _Tp, typename _Sequence = deque<_Tp>>
void std::stack< _Tp, _Sequence >::pop () [inline]`

Removes first element.

This is a typical stack operation. It shrinks the stack by one. The time complexity of the operation depends on the underlying sequence.

Note that no data is returned, and if the first element's data is needed, it should be retrieved before [pop\(\)](#) is called.

Definition at line 208 of file stl_stack.h.

5.653.3.3 `template<typename _Tp, typename _Sequence = deque<_Tp>>
void std::stack< _Tp, _Sequence >::push (const value_type & __x)
[inline]`

Add data to the top of the stack.

Parameters

x Data to be added.

This is a typical stack operation. The function creates an element at the top of the stack and assigns the given data to it. The time complexity of the operation depends on the underlying sequence.

Definition at line 182 of file stl_stack.h.

5.653.3.4 `template<typename _Tp, typename _Sequence = deque<_Tp>>
size_type std::stack< _Tp, _Sequence >::size () const [inline]`

Returns the number of elements in the stack.

Definition at line 147 of file stl_stack.h.

5.653.3.5 `template<typename _Tp, typename _Sequence = deque<_Tp>>
reference std::stack<_Tp, _Sequence>::top () [inline]`

Returns a read/write reference to the data at the first element of the stack.

Definition at line 155 of file `stl_stack.h`.

5.653.3.6 `template<typename _Tp, typename _Sequence = deque<_Tp>>
const_reference std::stack<_Tp, _Sequence>::top () const
[inline]`

Returns a read-only (constant) reference to the data at the first element of the stack.

Definition at line 166 of file `stl_stack.h`.

The documentation for this class was generated from the following file:

- [stl_stack.h](#)

5.654.3.5 `template<typename _RealType = double> void
std::student_t_distribution< _RealType >::param (const
param_type & __param) [inline]`

Sets the parameter set of the distribution.

Parameters

__param The new parameter set of the distribution.

5.654 std::student_t_distribution< _RealType > Class Template Reference 3029

Definition at line 3133 of file random.h.

5.654.3.6 `template<typename _RealType = double> void
std::student_t_distribution< _RealType >::reset() [inline]`

Resets the distribution state.

Definition at line 3108 of file random.h.

References `std::gamma_distribution< _RealType >::reset()`, and `std::normal_distribution< _RealType >::reset()`.

5.654.4 Friends And Related Function Documentation

5.654.4.1 `template<typename _RealType = double> template<typename
_RealType1 , typename _CharT , typename _Traits >
std::basic_ostream<_CharT, _Traits>& operator<<
(std::basic_ostream< _CharT, _Traits > & , const
std::student_t_distribution< _RealType1 > &) [friend]`

Inserts a student_t_distribution random number distribution `__x` into the output stream `__os`.

Parameters

`__os` An output stream.

`__x` A student_t_distribution random number distribution.

Returns

The output stream with the state of `__x` inserted or in an error state.

5.654.4.2 `template<typename _RealType = double> template<typename
_RealType1 > bool operator==(const std::student_t_distribution<
_RealType1 > & __d1, const std::student_t_distribution<
_RealType1 > & __d2) [friend]`

Return true if two Student t distributions have the same parameters and the sequences that would be generated are equal.

Definition at line 3177 of file random.h.

```

5.654.4.3 template<typename _RealType = double> template<typename
          _RealType1 , typename _CharT , typename _Traits >
          std::basic_istream<_CharT, _Traits>& operator>>
          ( std::basic_istream< _CharT, _Traits > & ,
            std::student_t_distribution< _RealType1 > & ) [friend]

```

Extracts a `student_t_distribution` random number distribution `__x` from the input stream `__is`.

Parameters

`__is` An input stream.

`__x` A `student_t_distribution` random number generator engine.

Returns

The input stream with `__x` extracted or in an error state.

- bool **matched**
- _Bilter [second](#)

5.656.1 Detailed Description

template<typename _Bilter> class std::sub_match< _Bilter >

A sequence of characters matched by a particular marked sub-expression.

An object of this class is essentially a pair of iterators marking a matched subexpression within a regular expression pattern match. Such objects can be converted to and compared with [std::basic_string](#) objects of a similar base character type as the pattern matched by the regular expression.

The iterators that make up the pair are the usual half-open interval referencing the actual original pattern matched.

Definition at line 756 of file regex.h.

5.656.2 Member Typedef Documentation

5.656.2.1 `typedef _Biliter std::pair< _Biliter , _Biliter >::first_type` [`inherited`]

`first_type` is the first bound type

Definition at line 86 of file `stl_pair.h`.

5.656.2.2 `typedef _Biliter std::pair< _Biliter , _Biliter >::second_type` [`inherited`]

`second_type` is the second bound type

Definition at line 87 of file `stl_pair.h`.

5.656.3 Member Function Documentation

5.656.3.1 `template<typename _Biliter> int std::sub_match< _Biliter >::compare (const sub_match< _Biliter > & __s) const` [`inline`]

Compares this and another matched sequence.

Parameters

`s` Another matched sequence to compare to this one.

Return values

`<0` this matched sequence will collate before `s`.

`=0` this matched sequence is equivalent to `s`.

`>0` this matched sequence will collate after `s`.

Definition at line 815 of file `regex.h`.

Referenced by `std::operator!=()`, `std::operator==()`, `std::operator>()`, and `std::operator>=()`.

5.656.3.2 `template<typename _Biliter> int std::sub_match< _Biliter >::compare (const string_type & __s) const` [`inline`]

Compares this `sub_match` to a string.

Parameters

s A string to compare to this [sub_match](#).

Return values

<0 this matched sequence will collate before *s*.

$=0$ this matched sequence is equivalent to *s*.

<0 this matched sequence will collate after *s*.

Definition at line 828 of file regex.h.

5.656.3.3 `template<typename _Biter> int std::sub_match< _Biter
>::compare (const value_type * __s) const [inline]`

Compares this [sub_match](#) to a C-style string.

Parameters

s A C-style string to compare to this [sub_match](#).

Return values

<0 this matched sequence will collate before *s*.

$=0$ this matched sequence is equivalent to *s*.

<0 this matched sequence will collate after *s*.

Definition at line 841 of file regex.h.

5.656.3.4 `template<typename _Biter> difference_type std::sub_match<
_Biter >::length () const [inline]`

Gets the length of the matching sequence.

Definition at line 772 of file regex.h.

5.656.3.5 `template<typename _Biter> std::sub_match< _Biter >::operator
string_type () const [inline]`

Gets the matching sequence as a string.

Returns

the matching sequence as a string.

This is the implicit conversion operator. It is identical to the [str\(\)](#) member function except that it will want to pop up in unexpected places and cause a great deal of confusion and cursing from the unwary.

Definition at line 785 of file regex.h.

5.656.3.6 `template<typename _BiIter> string_type std::sub_match<_BiIter>::str() const [inline]`

Gets the matching sequence as a string.

Returns

the matching sequence as a string.

Definition at line 798 of file regex.h.

Referenced by `std::sub_match<_BiIter>::compare()`, `std::operator!=()`, `std::operator<()`, `std::operator<=()`, `std::operator==()`, `std::operator>()`, and `std::operator>=()`.

5.656.4 Member Data Documentation

5.656.4.1 `_BiIter std::pair<_BiIter, _BiIter>::first [inherited]`

`first` is a copy of the first object

Definition at line 89 of file stl_pair.h.

Referenced by `std::sub_match<_BiIter>::length()`, `std::sub_match<_BiIter>::operator string_type()`, and `std::sub_match<_BiIter>::str()`.

5.656.4.2 `_BiIter std::pair<_BiIter, _BiIter>::second [inherited]`

`second` is a copy of the second object

Definition at line 90 of file stl_pair.h.

Referenced by `std::sub_match<_BiIter>::length()`, `std::sub_match<_BiIter>::operator string_type()`, and `std::sub_match<_BiIter>::str()`.

5.661.1 Detailed Description

`template<typename _CharT, typename _InIter> class std::time_get< _CharT, _InIter >`

Primary class template [time_get](#).

This facet encapsulates the code to parse and return a date or time from a string. It is used by the istream numeric extraction operators. The [time_get](#) template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the [time_get](#) facet.

Definition at line 363 of file [locale_facets_nonio.h](#).

5.661.2 Member Typedef Documentation

5.661.2.1 `template<typename _CharT, typename _InIter > typedef _CharT std::time_get< _CharT, _InIter >::char_type`

Public typedefs.

Reimplemented in [std::time_get_byname< _CharT, _InIter >](#).

Definition at line 369 of file locale_facets_nonio.h.

5.661.2.2 `template<typename _CharT, typename _InIter > typedef _InIter std::time_get< _CharT, _InIter >::iter_type`

Public typedefs.

Reimplemented in [std::time_get_byname< _CharT, _InIter >](#).

Definition at line 370 of file locale_facets_nonio.h.

5.661.3 Constructor & Destructor Documentation

5.661.3.1 `template<typename _CharT, typename _InIter > std::time_get< _CharT, _InIter >::time_get (size_t __refs = 0) [inline, explicit]`

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

refs Passed to the base facet class.

Definition at line 385 of file locale_facets_nonio.h.

5.661.3.2 `template<typename _CharT, typename _InIter > virtual std::time_get< _CharT, _InIter >::~~time_get () [inline, protected, virtual]`

Destructor.

Definition at line 541 of file locale_facets_nonio.h.

5.661.4 Member Function Documentation

5.661.4.1 `template<typename _CharT, typename _InIter > dateorder
std::time_get< _CharT, _InIter >::date_order () const [inline]`

Return preferred order of month, day, and year.

This function returns an enum from `timebase::dateorder` giving the preferred ordering if the format *x* given to `time_put::put()` only uses month, day, and year. If the format *x* for the associated locale uses other fields, this function returns `timebase::dateorder::noorder`.

NOTE: The library always returns `noorder` at the moment.

Returns

A member of `timebase::dateorder`.

Definition at line 402 of file `locale_facets_nonio.h`.

5.661.4.2 `template<typename _CharT, typename _InIter >
_GLIBCXX_END_LDBL_NAMESPACE time_base::dateorder
std::time_get< _CharT, _InIter >::do_date_order () const
[protected, virtual]`

Return preferred order of month, day, and year.

This function returns an enum from `timebase::dateorder` giving the preferred ordering if the format *x* given to `time_put::put()` only uses month, day, and year. This function is a hook for derived classes to change the value returned.

Returns

A member of `timebase::dateorder`.

Definition at line 618 of file `locale_facets_nonio.tcc`.

5.661.4.3 `template<typename _CharT, typename _InIter > _InIter
std::time_get< _CharT, _InIter >::do_get_date (iter_type __beg,
iter_type __end, ios_base & __io, ios_base::iostate & __err, tm *
__tm) const [protected, virtual]`

Parse input date string.

This function parses a date according to the format *X* and puts the results into a user-supplied struct `tm`. This function is a hook for derived classes to change the value returned.

See also

[get_date\(\)](#) for details.

Parameters

beg Start of string to parse.
end End of string to parse.
io Source of the locale.
err Error flags to set.
tm Pointer to struct tm to fill in.

Returns

Iterator to first char beyond date string.

Definition at line 1045 of file locale_facets_nonio.tcc.

References std::ios_base::_M_getloc(), and std::ios_base::eofbit.

```
5.661.4.4 template<typename _CharT , typename _InIter > _InIter  
std::time_get< _CharT, _InIter >::do_get_monthname ( iter_type  
__beg, iter_type __end, ios_base & __io, ios_base::iostate & __err,  
tm * __tm ) const [protected, virtual]
```

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct tm.
This function is a hook for derived classes to change the value returned.

See also

[get_monthname\(\)](#) for details.

Parameters

beg Start of string to parse.
end End of string to parse.
io Source of the locale.
err Error flags to set.
tm Pointer to struct tm to fill in.

Returns

Iterator to first char beyond month name.

Definition at line 1090 of file locale_facets_nonio.tcc.

References std::ios_base::_M_getloc(), std::ios_base::eofbit, std::ios_base::failbit, and std::ios_base::goodbit.

5.661.4.5 `template<typename _CharT, typename _InIter > _InIter
std::time_get< _CharT, _InIter >::do_get_time (iter_type __beg,
iter_type __end, ios_base & __io, ios_base::iostate & __err, tm *
__tm) const [protected, virtual]`

Parse input time string.

This function parses a time according to the format *x* and puts the results into a user-supplied struct *tm*. This function is a hook for derived classes to change the value returned.

See also

[get_time\(\)](#) for details.

Parameters

beg Start of string to parse.
end End of string to parse.
io Source of the locale.
err Error flags to set.
tm Pointer to struct *tm* to fill in.

Returns

Iterator to first char beyond time string.

Definition at line 1028 of file `locale_facets_nonio.tcc`.

References `std::ios_base::_M_getloc()`, and `std::ios_base::eofbit`.

5.661.4.6 `template<typename _CharT, typename _InIter > _InIter
std::time_get< _CharT, _InIter >::do_get_weekday (iter_type
__beg, iter_type __end, ios_base & __io, ios_base::iostate & __err,
tm * __tm) const [protected, virtual]`

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct *tm*. This function is a hook for derived classes to change the value returned.

See also

[get_weekday\(\)](#) for details.

Parameters

beg Start of string to parse.

end End of string to parse.
io Source of the locale.
err Error flags to set.
tm Pointer to struct tm to fill in.

Returns

Iterator to first char beyond weekday name.

Definition at line 1062 of file locale_facets_nonio.tcc.

References std::ios_base::_M_getloc(), std::ios_base::eofbit, std::ios_base::failbit, and std::ios_base::goodbit.

```
5.661.4.7 template<typename _CharT , typename _InIter > _InIter  
std::time_get< _CharT, _InIter >::do_get_year ( iter_type __beg,  
iter_type __end, ios_base & __io, ios_base::iostate & __err, tm *  
__tm ) const [protected, virtual]
```

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

[get_year\(\)](#) for details.

Parameters

beg Start of string to parse.
end End of string to parse.
io Source of the locale.
err Error flags to set.
tm Pointer to struct tm to fill in.

Returns

Iterator to first char beyond year.

Definition at line 1118 of file locale_facets_nonio.tcc.

References std::ios_base::_M_getloc(), std::ios_base::eofbit, std::ios_base::failbit, and std::ios_base::goodbit.

5.661.4.8 `template<typename _CharT, typename _InIter> iter_type
std::time_get<_CharT, _InIter>::get_date (iter_type __beg,
iter_type __end, ios_base & __io, ios_base::iostate & __err, tm *
__tm) const [inline]`

Parse input date string.

This function parses a date according to the format *x* and puts the results into a user-supplied struct *tm*. The result is returned by calling [time_get::do_get_date\(\)](#).

If there is a valid date string according to format *x*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the date string. If an error occurs before the end, *err* |= [ios_base::failbit](#). If parsing reads all the characters, *err* |= [ios_base::eofbit](#).

Parameters

beg Start of string to parse.
end End of string to parse.
io Source of the locale.
err Error flags to set.
tm Pointer to struct *tm* to fill in.

Returns

Iterator to first char beyond date string.

Definition at line 451 of file `locale_facets_nonio.h`.

5.661.4.9 `template<typename _CharT, typename _InIter> iter_type
std::time_get<_CharT, _InIter>::get_monthname (iter_type
__beg, iter_type __end, ios_base & __io, ios_base::iostate & __err,
tm * __tm) const [inline]`

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct *tm*. The result is returned by calling [time_get::do_get_monthname\(\)](#).

Parsing starts by parsing an abbreviated month name. If a valid abbreviation is followed by a character that would lead to the full month name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, *err* |= [ios_base::failbit](#). If parsing reads all the characters, *err* |= [ios_base::eofbit](#).

Parameters

beg Start of string to parse.
end End of string to parse.
io Source of the locale.
err Error flags to set.
tm Pointer to struct tm to fill in.

Returns

Iterator to first char beyond month name.

Definition at line 508 of file locale_facets_nonio.h.

```
5.661.4.10 template<typename _CharT , typename _InIter > iter_type  
std::time_get< _CharT, _InIter >::get_time ( iter_type __beg,  
iter_type __end, ios_base & __io, ios_base::iostate & __err, tm *  
__tm ) const [inline]
```

Parse input time string.

This function parses a time according to the format *X* and puts the results into a user-supplied struct tm. The result is returned by calling [time_get::do_get_time\(\)](#).

If there is a valid time string according to format *X*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the time string. If an error occurs before the end, err |= [ios_base::failbit](#). If parsing reads all the characters, err |= [ios_base::eofbit](#).

Parameters

beg Start of string to parse.
end End of string to parse.
io Source of the locale.
err Error flags to set.
tm Pointer to struct tm to fill in.

Returns

Iterator to first char beyond time string.

Definition at line 426 of file locale_facets_nonio.h.

5.661.4.11 `template<typename _CharT, typename _InIter> iter_type
std::time_get<_CharT, _InIter>::get_weekday (iter_type __beg,
iter_type __end, ios_base & __io, ios_base::iostate & __err, tm *
__tm) const [inline]`

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_weekday()`.

Parsing starts by parsing an abbreviated weekday name. If a valid abbreviation is followed by a character that would lead to the full weekday name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, err |= `ios_base::failbit`. If parsing reads all the characters, err |= `ios_base::eofbit`.

Parameters

beg Start of string to parse.
end End of string to parse.
io Source of the locale.
err Error flags to set.
tm Pointer to struct tm to fill in.

Returns

Iterator to first char beyond weekday name.

Definition at line 479 of file locale_facets_nonio.h.

5.661.4.12 `template<typename _CharT, typename _InIter> iter_type
std::time_get<_CharT, _InIter>::get_year (iter_type __beg,
iter_type __end, ios_base & __io, ios_base::iostate & __err, tm *
__tm) const [inline]`

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. The result is returned by calling `time_get::do_get_year()`.

4 consecutive digits are interpreted as a full year. If there are exactly 2 consecutive digits, the library interprets this as the number of years since 1900.

If an error occurs before the end, err |= `ios_base::failbit`. If parsing reads all the characters, err |= `ios_base::eofbit`.

5.662 std::time_get_byname<_CharT, _InIter > Class Template Reference 3051

Parameters

- beg* Start of string to parse.
- end* End of string to parse.
- io* Source of the locale.
- err* Error flags to set.
- tm* Pointer to struct tm to fill in.

Returns

Iterator to first char beyond year.

Definition at line 534 of file locale_facets_nonio.h.

5.661.5 Member Data Documentation

5.661.5.1 template<typename _CharT, typename _InIter > locale::id std::time_get<_CharT, _InIter >::id [static]

5.662.3 Member Function Documentation

5.662.3.1 `template<typename _CharT , typename _InIter > dateorder std::time_get< _CharT, _InIter >::date_order () const [inline, inherited]`

Return preferred order of month, day, and year.

This function returns an enum from `timebase::dateorder` giving the preferred ordering if the format *x* given to [time_put::put\(\)](#) only uses month, day, and year. If the format *x* for the associated locale uses other fields, this function returns `timebase::dateorder::noorder`.

5.662 `std::time_get_byname<_CharT, _InIter>` Class Template Reference 3055

NOTE: The library always returns noorder at the moment.

Returns

A member of `timebase::dateorder`.

Definition at line 402 of file `locale_facets_nonio.h`.

```
5.662.3.2  template<typename _CharT , typename _InIter >
           _GLIBCXX_END_LDBL_NAMESPACE time_base::dateorder
           std::time_get< _CharT, _InIter >::do_date_order ( ) const
           [protected, virtual, inherited]
```

Return preferred order of month, day, and year.

This function returns an enum from `timebase::dateorder` giving the preferred ordering if the format `x` given to [time_put::put\(\)](#) only uses month, day, and year. This function is a hook for derived classes to change the value returned.

Returns

A member of `timebase::dateorder`.

Definition at line 618 of file `locale_facets_nonio.tcc`.

```
5.662.3.3  template<typename _CharT , typename _InIter > _InIter
           std::time_get< _CharT, _InIter >::do_get_date ( iter_type __beg,
           iter_type __end, ios_base & __io, ios_base::iostate & __err, tm *
           __tm ) const [protected, virtual, inherited]
```

Parse input date string.

This function parses a date according to the format `X` and puts the results into a user-supplied struct `tm`. This function is a hook for derived classes to change the value returned.

See also

[get_date\(\)](#) for details.

Parameters

beg Start of string to parse.

end End of string to parse.

io Source of the locale.

err Error flags to set.

tm Pointer to struct tm to fill in.

Returns

Iterator to first char beyond date string.

Definition at line 1045 of file locale_facets_nonio.tcc.

References std::ios_base::_M_getloc(), and std::ios_base::eofbit.

```
5.662.3.4 template<typename _CharT , typename _InIter > _InIter
std::time_get< _CharT, _InIter >::do_get_monthname ( iter_type
__beg, iter_type __end, ios_base & __io, ios_base::iostate & __err,
tm * __tm ) const [protected, virtual, inherited]
```

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct tm. This function is a hook for derived classes to change the value returned.

See also

[get_monthname\(\)](#) for details.

Parameters

beg Start of string to parse.

end End of string to parse.

io Source of the locale.

err Error flags to set.

tm Pointer to struct tm to fill in.

Returns

Iterator to first char beyond month name.

Definition at line 1090 of file locale_facets_nonio.tcc.

References std::ios_base::_M_getloc(), std::ios_base::eofbit, std::ios_base::failbit, and std::ios_base::goodbit.

```
5.662.3.5 template<typename _CharT , typename _InIter > _InIter
std::time_get< _CharT, _InIter >::do_get_time ( iter_type __beg,
iter_type __end, ios_base & __io, ios_base::iostate & __err, tm *
__tm ) const [protected, virtual, inherited]
```

Parse input time string.

5.662 std::time_get_byname<_CharT, _InIter> Class Template Reference 3057

This function parses a time according to the format *x* and puts the results into a user-supplied struct *tm*. This function is a hook for derived classes to change the value returned.

See also

[get_time\(\)](#) for details.

Parameters

beg Start of string to parse.
end End of string to parse.
io Source of the locale.
err Error flags to set.
tm Pointer to struct *tm* to fill in.

Returns

Iterator to first char beyond time string.

Definition at line 1028 of file locale_facets_nonio.tcc.

References std::ios_base::_M_getloc(), and std::ios_base::eofbit.

```
5.662.3.6 template<typename _CharT, typename _InIter> _InIter  
std::time_get<_CharT, _InIter>::do_get_weekday ( iter_type

tm * __tm ) const [protected, virtual, inherited]
```

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct *tm*. This function is a hook for derived classes to change the value returned.

See also

[get_weekday\(\)](#) for details.

Parameters

beg Start of string to parse.
end End of string to parse.
io Source of the locale.
err Error flags to set.
tm Pointer to struct *tm* to fill in.

Returns

Iterator to first char beyond weekday name.

Definition at line 1062 of file locale_facets_nonio.tcc.

References `std::ios_base::_M_getloc()`, `std::ios_base::eofbit`, `std::ios_base::failbit`, and `std::ios_base::goodbit`.

5.662.3.7 `template<typename _CharT, typename _InIter> _InIter
std::time_get<_CharT, _InIter>::do_get_year(iter_type __beg,
iter_type __end, ios_base & __io, ios_base::iostate & __err, tm *
__tm) const [protected, virtual, inherited]`

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct `tm`. This function is a hook for derived classes to change the value returned.

See also

[get_year\(\)](#) for details.

Parameters

beg Start of string to parse.

end End of string to parse.

io Source of the locale.

err Error flags to set.

tm Pointer to struct `tm` to fill in.

Returns

Iterator to first char beyond year.

Definition at line 1118 of file locale_facets_nonio.tcc.

References `std::ios_base::_M_getloc()`, `std::ios_base::eofbit`, `std::ios_base::failbit`, and `std::ios_base::goodbit`.

5.662.3.8 `template<typename _CharT, typename _InIter> iter_type
std::time_get<_CharT, _InIter>::get_date(iter_type __beg,
iter_type __end, ios_base & __io, ios_base::iostate & __err, tm *
__tm) const [inline, inherited]`

Parse input date string.

5.662 std::time_get_byname<_CharT, _InIter> Class Template Reference 3059

This function parses a date according to the format *x* and puts the results into a user-supplied struct *tm*. The result is returned by calling [time_get::do_get_date\(\)](#).

If there is a valid date string according to format *x*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the date string. If an error occurs before the end, err |= [ios_base::failbit](#). If parsing reads all the characters, err |= [ios_base::eofbit](#).

Parameters

- beg* Start of string to parse.
- end* End of string to parse.
- io* Source of the locale.
- err* Error flags to set.
- tm* Pointer to struct *tm* to fill in.

Returns

Iterator to first char beyond date string.

Definition at line 451 of file locale_facets_nonio.h.

```
5.662.3.9  template<typename _CharT, typename _InIter> iter_type
           std::time_get<_CharT, _InIter>::get_monthname ( iter_type
           __beg, iter_type __end, ios_base & __io, ios_base::iostate & __err,
           tm * __tm ) const [inline, inherited]
```

Parse input month string.

This function parses a month name and puts the results into a user-supplied struct *tm*. The result is returned by calling [time_get::do_get_monthname\(\)](#).

Parsing starts by parsing an abbreviated month name. If a valid abbreviation is followed by a character that would lead to the full month name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, err |= [ios_base::failbit](#). If parsing reads all the characters, err |= [ios_base::eofbit](#).

Parameters

- beg* Start of string to parse.
- end* End of string to parse.
- io* Source of the locale.
- err* Error flags to set.

tm Pointer to struct tm to fill in.

Returns

Iterator to first char beyond month name.

Definition at line 508 of file locale_facets_nonio.h.

```
5.662.3.10  template<typename _CharT , typename _InIter > iter_type
              std::time_get< _CharT, _InIter >::get_time ( iter_type __beg,
              iter_type __end, ios_base & __io, ios_base::iostate & __err, tm *
              __tm ) const [inline, inherited]
```

Parse input time string.

This function parses a time according to the format *X* and puts the results into a user-supplied struct tm. The result is returned by calling [time_get::do_get_time\(\)](#).

If there is a valid time string according to format *X*, *tm* will be filled in accordingly and the returned iterator will point to the first character beyond the time string. If an error occurs before the end, err |= [ios_base::failbit](#). If parsing reads all the characters, err |= [ios_base::eofbit](#).

Parameters

beg Start of string to parse.

end End of string to parse.

io Source of the locale.

err Error flags to set.

tm Pointer to struct tm to fill in.

Returns

Iterator to first char beyond time string.

Definition at line 426 of file locale_facets_nonio.h.

```
5.662.3.11  template<typename _CharT , typename _InIter > iter_type
              std::time_get< _CharT, _InIter >::get_weekday ( iter_type __beg,
              iter_type __end, ios_base & __io, ios_base::iostate & __err, tm *
              __tm ) const [inline, inherited]
```

Parse input weekday string.

This function parses a weekday name and puts the results into a user-supplied struct tm. The result is returned by calling [time_get::do_get_weekday\(\)](#).

5.662 std::time_get_byname<_CharT, _InIter> Class Template Reference 3061

Parsing starts by parsing an abbreviated weekday name. If a valid abbreviation is followed by a character that would lead to the full weekday name, parsing continues until the full name is found or an error occurs. Otherwise parsing finishes at the end of the abbreviated name.

If an error occurs before the end, err |= [ios_base::failbit](#). If parsing reads all the characters, err |= [ios_base::eofbit](#).

Parameters

- beg* Start of string to parse.
- end* End of string to parse.
- io* Source of the locale.
- err* Error flags to set.
- tm* Pointer to struct tm to fill in.

Returns

Iterator to first char beyond weekday name.

Definition at line 479 of file locale_facets_nonio.h.

```
5.662.3.12  template<typename _CharT, typename _InIter> iter_type
std::time_get<_CharT, _InIter>::get_year ( iter_type __beg,
iter_type __end, ios_base & __io, ios_base::iostate & __err, tm *
__tm ) const [inline, inherited]
```

Parse input year string.

This function reads up to 4 characters to parse a year string and puts the results into a user-supplied struct tm. The result is returned by calling [time_get::do_get_year\(\)](#).

4 consecutive digits are interpreted as a full year. If there are exactly 2 consecutive digits, the library interprets this as the number of years since 1900.

If an error occurs before the end, err |= [ios_base::failbit](#). If parsing reads all the characters, err |= [ios_base::eofbit](#).

Parameters

- beg* Start of string to parse.
- end* End of string to parse.
- io* Source of the locale.
- err* Error flags to set.
- tm* Pointer to struct tm to fill in.

Returns

Iterator to first char beyond year.

Definition at line 534 of file `locale_facets_nonio.h`.

5.663.1 Detailed Description

`template<typename _CharT, typename _OutIter> class std::time_put< _CharT, _OutIter >`

Primary class template [time_put](#).

This facet encapsulates the code to format and output dates and times according to formats used by `strftime()`. The [time_put](#) template uses protected virtual functions to provide the actual results. The public accessors forward the call to the virtual functions. These virtual functions are hooks for developers to implement the behavior they require from the [time_put](#) facet.

Definition at line 710 of file `locale_facets_nonio.h`.

5.663.2 Member Typedef Documentation

5.663.3.1 `template<typename _CharT, typename _OutIter> std::time_put< _CharT, _OutIter>::time_put (size_t __refs = 0) [inline, explicit]`

Constructor performs initialization.

This is the constructor provided by the standard.

Parameters

refs Passed to the base facet class.

Definition at line 731 of file locale_facets_nonio.h.

5.663.3.2 `template<typename _CharT, typename _OutIter> virtual std::time_put<_CharT, _OutIter>::~~time_put () [inline, protected, virtual]`

Destructor.

Definition at line 777 of file locale_facets_nonio.h.

5.663.4 Member Function Documentation

5.663.4.1 `template<typename _CharT, typename _OutIter> _OutIter std::time_put<_CharT, _OutIter>::do_put (iter_type __s, ios_base & __io, char_type __fill, const tm * __tm, char __format, char __mod) const [protected, virtual]`

Format and output a time or date.

This function formats the data in struct tm according to the provided format char and optional modifier. This function is a hook for derived classes to change the value returned.

See also

[put\(\)](#) for more details.

Parameters

s The stream to write to.
io Source of locale.
fill char_type to use for padding.
tm Struct tm with date and time info to format.
format Format char.
mod Optional modifier char.

Returns

Iterator after writing.

Definition at line 1176 of file locale_facets_nonio.tcc.

References `std::ios_base::_M_getloc()`, and `std::__ctype_abstract_base< _CharT >::widen()`.

Referenced by `std::time_put< _CharT, _OutIter >::put()`.

5.673 std::tr1::bad_weak_ptr Class Reference

Exception possibly thrown by [shared_ptr](#).

Inheritance diagram for std::tr1::bad_weak_ptr:

Public Member Functions

- virtual char const * [what](#) () const throw ()

5.673.1 Detailed Description

Exception possibly thrown by [shared_ptr](#).

Definition at line 58 of file boost_sp_counted_base.h.

5.673.2 Member Function Documentation

5.673.2.1 virtual char const* std::tr1::bad_weak_ptr::what () const throw () [inline, virtual]

Returns a C-style character string describing the general cause of the current error.

Reimplemented from [std::exception](#).

Definition at line 62 of file boost_sp_counted_base.h.

The documentation for this class was generated from the following file:

- [boost_sp_counted_base.h](#)

5.674 `std::tr1::extent< typename, _Uint >` Struct Template Reference

extent

Inheritance diagram for `std::tr1::extent< typename, _Uint >`:

Public Types

- typedef `integral_constant< std::size_t, __v >` **type**
- typedef `std::size_t` **value_type**

Static Public Attributes

- static const `std::size_t` **value**

5.674.1 Detailed Description

```
template<typename, unsigned _Uint = 0> struct std::tr1::extent< typename, _
_Uint >
```

extent

5.675 `std::tr1::has_virtual_destructor< _Tp >` Struct Template Reference 3081

5.712.1 Detailed Description

```
template<typename... _Elements> struct std::tuple_size< tuple< _Elements...>>
>
```

```
class tuple_size
```

Definition at line 500 of file tuple.

The documentation for this struct was generated from the following file:

- [tuple](#)

5.713 std::type_info Class Reference

Part of RTTI.

Inherited by `__cxxabiv1::__array_type_info`, `__cxxabiv1::__class_type_info`, `__cxxabiv1::__enum_type_info`, `__cxxabiv1::__function_type_info`, `__cxxabiv1::__fundamental_type_info`, and `__cxxabiv1::__pbase_type_info`.

Public Member Functions

- virtual `~type_info()`
- virtual bool `__do_catch` (const `type_info` *`__thr_type`, void **`__thr_obj`, unsigned `__outer`) const
- virtual bool `__do_upcast` (const `__cxxabiv1::__class_type_info` *`__target`, void **`__obj_ptr`) const
- virtual bool `__is_function_p` () const
- virtual bool `__is_pointer_p` () const
- bool `before` (const `type_info` &`__arg`) const
- size_t `hash_code` () const throw ()
- const char * `name` () const
- bool `operator!=` (const `type_info` &`__arg`) const
- bool `operator==` (const `type_info` &`__arg`) const

Protected Member Functions

- `type_info` (const char *`__n`)

Protected Attributes

- const char * `__name`

5.713.1 Detailed Description

Part of RTTI. The `type_info` class describes type information generated by an implementation.

Definition at line 92 of file typeinfo.

5.713.2 Constructor & Destructor Documentation

5.713.2.1 virtual std::type_info::~~type_info () [virtual]

Destructor first. Being the first non-inline virtual function, this controls in which translation unit the vtable is emitted. The compiler makes use of that information to know where to emit the runtime-mandated [type_info](#) structures in the new-abi.

5.713.3 Member Function Documentation

5.713.3.1 const char* std::type_info::name () const [inline]

Returns an *implementation-defined* byte string; this is not portable between compilers!

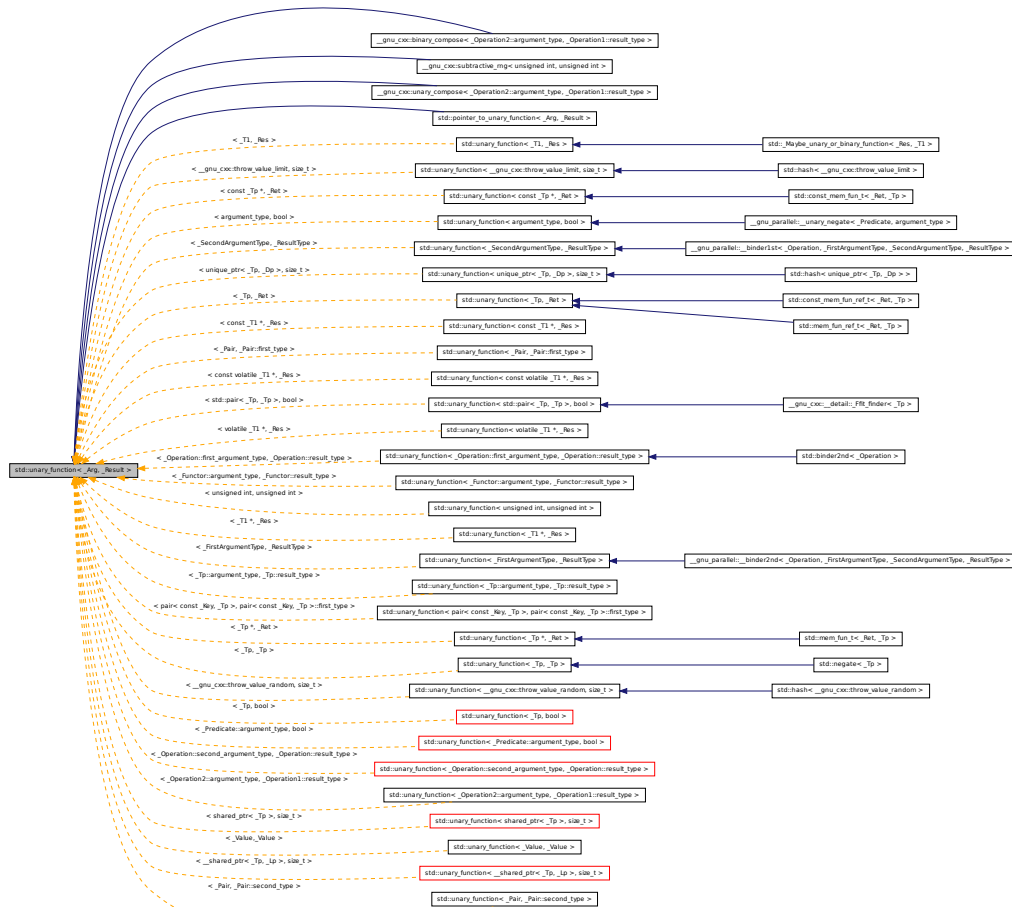

Definition at line 103 of file typeinfo.

The documentation for this class was generated from the following file:

- [typeinfo](#)

5.714 std::unary_function< _Arg, _Result > Struct Template Reference

Inheritance diagram for std::unary_function< _Arg, _Result >:

Public Types

- typedef `_Arg` `argument_type`
- typedef `_Result` `result_type`

5.714.1 Detailed Description

template<typename _Arg, typename _Result> struct std::unary_function< _Arg, _Result >

This is one of the [functor base classes](#).

Definition at line 100 of file stl_function.h.

5.714.2 Member Typedef Documentation

**5.714.2.1 template<typename _Arg, typename _Result> typedef _Arg
std::unary_function< _Arg, _Result >::argument_type**

`argument_type` is the type of the /// argument (no surprises here)

Definition at line 102 of file stl_function.h.

**5.714.2.2 template<typename _Arg, typename _Result> typedef _Result
std::unary_function< _Arg, _Result >::result_type**

`result_type` is the return type

Definition at line 105 of file stl_function.h.

The documentation for this struct was generated from the following file:

- [stl_function.h](#)

5.715 **std::unary_negate< _Predicate > Class Template Reference**

One of the [negation functors](#).

Inheritance diagram for std::unary_negate< _Predicate >:

Public Types

- typedef `_Predicate::argument_type` [argument_type](#)
- typedef `bool` [result_type](#)

Public Member Functions

- **unary_negate** (const `_Predicate` &__x)
- **bool operator()** (const typename `_Predicate::argument_type` &__x) const

Protected Attributes

- `_Predicate` **_M_pred**

5.715.1 Detailed Description

`template<typename _Predicate> class std::unary_negate< _Predicate >`

One of the [negation functors](#).

Definition at line 346 of file `stl_function.h`.

5.715.2 Member Typedef Documentation

5.715.2.1 `typedef _Predicate::argument_type std::unary_function< _Predicate::argument_type , bool >::argument_type [inherited]`

`argument_type` is the type of the /// argument (no surprises here)

Definition at line 102 of file `stl_function.h`.

5.715.2.2 `typedef bool std::unary_function< _Predicate::argument_type , bool >::result_type [inherited]`

`result_type` is the return type

Definition at line 105 of file `stl_function.h`.

The documentation for this class was generated from the following file:

- [stl_function.h](#)

5.716 `std::underflow_error` Class Reference

Inheritance diagram for `std::underflow_error`:

Public Member Functions

- **`underflow_error`** (const [string](#) &__arg)
- virtual const char * [what](#) () const throw ()

5.716.1 Detailed Description

Thrown to indicate arithmetic underflow.

Definition at line 140 of file `stdexcept`.

5.716.2 Member Function Documentation

5.716.2.1 `virtual const char* std::runtime_error::what () const throw ()` [[virtual](#), [inherited](#)]

Returns a C-style character string describing the general cause of the current error (the same string passed to the ctor).

Reimplemented from [std::exception](#).

The documentation for this class was generated from the following file:

- [stdexcept](#)

5.717 `std::uniform_int_distribution< _IntType >` Class Template Reference

Uniform discrete distribution for random numbers. A discrete random distribution on the range $[min, max]$ with equal probability throughout the range.

Classes

- struct [param_type](#)

Public Types

- typedef `_IntType` [result_type](#)

Public Member Functions

- void [param](#) (const [param_type](#) &__param)
- [param_type param](#) () const
- void [reset](#) ()

Public Attributes

- [param_type _M_param](#)

5.717.1 Detailed Description

template<typename _IntType = int> class std::uniform_int_distribution< _IntType >

Uniform discrete distribution for random numbers. A discrete random distribution on the range $[min, max]$ with equal probability throughout the range.

Definition at line 1631 of file random.h.

5.717.2 Member Typedef Documentation

5.717.2.1 `template<typename _IntType = int> typedef _IntType
std::uniform_int_distribution<_IntType>::result_type`

The type of the range of the distribution.

Definition at line 1638 of file random.h.

5.717.3 Constructor & Destructor Documentation

5.717.3.1 `template<typename _IntType = int> std::uniform_int_distribution<
_IntType>::uniform_int_distribution (_IntType __a = 0, _IntType
__b = std::numeric_limits<_IntType>::max()) [inline,
explicit]`

Constructs a uniform distribution object.

Definition at line 1674 of file random.h.

5.717.4 Member Function Documentation

5.717.4.1 `template<typename _IntType = int> result_type
std::uniform_int_distribution<_IntType>::max () const
[inline]`

Returns the inclusive upper bound of the distribution range.

Definition at line 1726 of file random.h.

5.717.4.2 `template<typename _IntType = int> result_type
std::uniform_int_distribution< _IntType >::min () const
[inline]`

Returns the inclusive lower bound of the distribution range.

Definition at line 1719 of file random.h.

5.717.4.3 `template<typename _IntType = int> template<typename
_UniformRandomNumberGenerator > result_type
std::uniform_int_distribution< _IntType >::operator() (
_UniformRandomNumberGenerator & __urng) [inline]`

Generating functions.

Definition at line 1734 of file random.h.

References `std::uniform_int_distribution< _IntType >::operator()()`, and `std::uniform_int_distribution< _IntType >::param()`.

Referenced by `std::uniform_int_distribution< _IntType >::operator()()`.

5.717.4.4 `template<typename _IntType = int> void std::uniform_int_
distribution< _IntType >::param (const param_type & __param)
[inline]`

Sets the parameter set of the distribution.

Parameters

`__param` The new parameter set of the distribution.

Definition at line 1712 of file random.h.

5.717.4.5 `template<typename _IntType = int> param_type
std::uniform_int_distribution< _IntType >::param () const
[inline]`

Returns the parameter set of the distribution.

Definition at line 1704 of file random.h.

Referenced by `std::uniform_int_distribution< _IntType >::operator()()`, `std::operator==()`, and `std::operator>>()`.

5.718 `std::uniform_int_distribution<_IntType>::param_type` Struct Reference 3125

5.717.4.6 `template<typename _IntType = int> void
std::uniform_int_distribution<_IntType>::reset () [inline]`

Resets the distribution state.

Does nothing for the uniform integer distribution.

Definition at line 1690 of file `random.h`.

The documentation for this class was generated from the following files:

- [random.h](#)
- [random.tcc](#)

5.718 `std::uniform_int_distribution<_IntType>::param_type` Struct Reference

- `result_type b` () const

Friends

- bool `operator==` (const `param_type` &__p1, const `param_type` &__p2)

5.718.1 Detailed Description

`template<typename _IntType = int> struct std::uniform_int_distribution<_IntType>::param_type`

Parameter type.

Definition at line 1640 of file `random.h`.

The documentation for this struct was generated from the following file:

- [random.h](#)

5.719 `std::uniform_real_distribution< _RealType >` Class Template Reference

Uniform continuous distribution for random numbers.

Classes

- struct `param_type`

Public Types

- typedef `_RealType` `result_type`

Public Member Functions

- `uniform_real_distribution` (`_RealType __a=_RealType(0), _RealType __b=-RealType(1)`)
- `uniform_real_distribution` (`const param_type &__p`)
- `result_type a` () const
- `result_type b` () const
- `result_type max` () const
- `result_type min` () const
- `template<typename _UniformRandomNumberGenerator > result_type operator()` (`_UniformRandomNumberGenerator &__urng, const param_type &__p`)
- `template<typename _UniformRandomNumberGenerator > result_type operator()` (`_UniformRandomNumberGenerator &__urng`)
- `void param` (`const param_type &__param`)
- `param_type param` () const
- `void reset` ()

5.719.1 Detailed Description

```
template<typename _RealType = double> class std::uniform_real_distribution<
_RealType >
```

Uniform continuous distribution for random numbers. A continuous random distribution on the range [min, max) with equal probability throughout the range. The URNG should be real-valued and deliver number in the range [0, 1).

Definition at line 1803 of file random.h.

5.719.2 Member Typedef Documentation

5.719.2.1 `template<typename _RealType = double> typedef _RealType
std::uniform_real_distribution<_RealType>::result_type`

The type of the range of the distribution.

Definition at line 1810 of file `random.h`.

5.719.3 Constructor & Destructor Documentation

5.719.3.1 `template<typename _RealType = double> std::uniform_real_
distribution<_RealType>::uniform_real_distribution (_RealType
__a = _RealType(0), _RealType __b = _RealType(1))
[inline, explicit]`

Constructs a [uniform_real_distribution](#) object.

Parameters

`__min` [IN] The lower bound of the distribution.

`__max` [IN] The upper bound of the distribution.

Definition at line 1849 of file `random.h`.

5.719.4 Member Function Documentation

5.719.4.1 `template<typename _RealType = double> result_type
std::uniform_real_distribution<_RealType>::max () const
[inline]`

Returns the inclusive upper bound of the distribution range.

Definition at line 1901 of file `random.h`.

5.719.4.2 `template<typename _RealType = double> result_type
std::uniform_real_distribution<_RealType>::min () const
[inline]`

Returns the inclusive lower bound of the distribution range.

Definition at line 1894 of file `random.h`.

5.719.4.3 `template<typename _RealType = double> template<typename
_UniformRandomNumberGenerator > result_type
std::uniform_real_distribution< _RealType >::operator() (
_UniformRandomNumberGenerator & __urng) [inline]`

Generating functions.

Definition at line 1909 of file random.h.

References `std::uniform_real_distribution< _RealType >::operator()()`, and
`std::uniform_real_distribution< _RealType >::param()`.

Referenced by `std::uniform_real_distribution< _RealType >::operator()()`.

5.719.4.4 `template<typename _RealType = double> void
std::uniform_real_distribution< _RealType >::param (const
param_type & __param) [inline]`

Sets the parameter set of the distribution.

Parameters

`__param` The new parameter set of the distribution.

Definition at line 1887 of file random.h.

5.719.4.5 `template<typename _RealType = double> param_type
std::uniform_real_distribution< _RealType >::param () const
[inline]`

Returns the parameter set of the distribution.

Definition at line 1879 of file random.h.

Referenced by `std::uniform_real_distribution< _RealType >::operator()()`,
`std::operator==()`, and `std::operator>>()`.

5.719.4.6 `template<typename _RealType = double> void
std::uniform_real_distribution< _RealType >::reset ()
[inline]`

Resets the distribution state.

Does nothing for the uniform real distribution.

Definition at line 1865 of file random.h.

5.724.1 Detailed Description

```
template<class _Key, class _Tp, class _Hash = hash<_Key>, class _Pred =
std::equal_to<_Key>, class _Alloc = std::allocator<std::pair<const _Key, _Tp>
>> class std::unordered_map< _Key, _Tp, _Hash, _Pred, _Alloc >
```

A standard container composed of unique keys (containing at most one of each key value) that associates values of another type with the keys. Meets the requirements of a [container](#), and [unordered associative container](#)

Parameters

- Key* Type of key objects.
- Tp* Type of mapped objects.
- Hash* Hashing function object type, defaults to `hash<Value>`.
- Pred* Predicate function object type, defaults to `equal_to<Value>`.
- Alloc* Allocator type, defaults to `allocator<Key>`.

The resulting value type of the container is `std::pair<const Key, Tp>`.

Definition at line 254 of file `unordered_map.h`.

The documentation for this class was generated from the following file:

- [unordered_map.h](#)

5.725 `std::unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >` Class Template Reference

A standard container composed of equivalent keys (possibly containing multiple of each key value) that associates values of another type with the keys.

Inherits `std::__unordered_multimap< _Key, _Tp, _Hash, _Pred, _Alloc >`.

5.729.1 Detailed Description

`template<class _Tp> class std::valarray< _Tp >`

Smart array designed to support numeric processing. A valarray is an array that provides constraints intended to allow for effective optimization of numeric array processing by reducing the aliasing that can result from pointer representations. It represents a one-dimensional array from which different multidimensional subsets can be accessed and modified.

Parameters

Tp Type of object in the array.

Definition at line 111 of file valarray.

5.729.2 Constructor & Destructor Documentation

5.729.2.1 `template<class _Tp> std::valarray< _Tp >::valarray (const _Tp * __restrict__, size_t)`

Construct an array initialized to the first n elements of t .

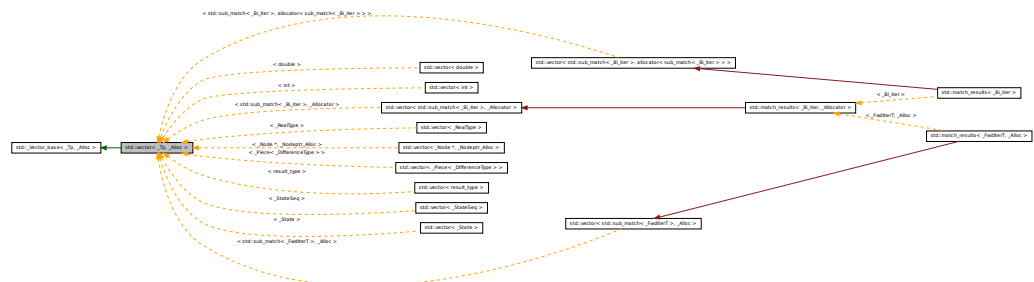

The documentation for this class was generated from the following file:

- [valarray](#)

5.730.1 Detailed Description

`template<typename _Tp, typename _Alloc = std::allocator<_Tp>> class`
`std::vector< _Tp, _Alloc >`

A standard container which offers fixed time access to individual elements in any order. Meets the requirements of a [container](#), a [reversible container](#), and a [sequence](#), including the [optional sequence requirements](#) with the exception of `push_front` and `pop_front`.

In some terminology a vector can be described as a dynamic C-style array, it offers fast and efficient access to individual elements in any order and saves the user from worrying about memory and size allocation. Subscripting (`[]`) access is also provided as with C-style arrays.

Definition at line 178 of file `stl_vector.h`.

5.730.2 Constructor & Destructor Documentation

5.730.2.1 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>`
`std::vector< _Tp, _Alloc >::vector () [inline]`

Default constructor creates no elements.

Definition at line 215 of file `stl_vector.h`.

5.730.2.2 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (const allocator_type & __a)
[inline, explicit]`

Creates a vector with no elements.

Parameters

a An allocator object.

Definition at line 223 of file stl_vector.h.

5.730.2.3 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (size_type __n) [inline,
explicit]`

Creates a vector with default constructed elements.

Parameters

n The number of elements to initially create.

This constructor fills the vector with *n* default constructed elements.

Definition at line 235 of file stl_vector.h.

5.730.2.4 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector< _Tp, _Alloc >::vector (size_type __n, const value_type
& __value, const allocator_type & __a = allocator_type())
[inline]`

Creates a vector with copies of an exemplar element.

Parameters

n The number of elements to initially create.

value An element to copy.

a An allocator.

This constructor fills the vector with *n* copies of *value*.

Definition at line 247 of file stl_vector.h.

5.730.2.5 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector<_Tp, _Alloc>::vector (const vector<_Tp, _Alloc> &
__x) [inline]`

Vector copy constructor.

Parameters

x A vector of identical element and allocator types.

The newly-created vector uses a copy of the allocation object used by *x*. All the elements of *x* are copied, but any extra memory in *x* (for fast expansion) will not be copied.

Definition at line 276 of file `stl_vector.h`.

5.730.2.6 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector<_Tp, _Alloc>::vector (vector<_Tp, _Alloc> && __x
) [inline]`

Vector move constructor.

Parameters

x A vector of identical element and allocator types.

The newly-created vector contains the exact contents of *x*. The contents of *x* are a valid, but unspecified vector.

Definition at line 292 of file `stl_vector.h`.

5.730.2.7 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
std::vector<_Tp, _Alloc>::vector (initializer_list< value_type
> __l, const allocator_type & __a = allocator_type())
[inline]`

Builds a vector from an initializer list.

Parameters

l An [initializer_list](#).

a An allocator.

Create a vector consisting of copies of the elements in the [initializer_list](#) *l*.

This will call the element type's copy constructor *N* times (where *N* is *l.size()*) and do no memory reallocation.

Definition at line 306 of file `stl_vector.h`.

```

5.730.2.8  template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
             template<typename _InputIterator > std::vector< _Tp, _Alloc
             >::vector ( _InputIterator __first, _InputIterator __last, const
             allocator_type & __a = allocator_type() ) [inline]

```

Builds a vector from a range.

Parameters

first An input iterator.

last An input iterator.

a An allocator.

Create a vector consisting of copies of the elements from [first,last).

If the iterators are forward, bidirectional, or random-access, then this will call the elements' copy constructor *N* times (where *N* is distance(first,last)) and do no memory reallocation. But if only input iterators are used, then this will do at most 2*N* calls to the copy constructor, and log*N* memory reallocations.

Definition at line 332 of file stl_vector.h.

```

5.730.2.9  template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
             std::vector< _Tp, _Alloc >::~~vector ( ) [inline]

```

The dtor only erases the elements, and note that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 347 of file stl_vector.h.

5.730.3 Member Function Documentation

```

5.730.3.1  template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
             template<typename _ForwardIterator > pointer std::vector< _Tp,
             _Alloc >::_M_allocate_and_copy ( size_type __n, _ForwardIterator
             __first, _ForwardIterator __last ) [inline, protected]

```

Memory expansion handler. Uses the member allocation function to obtain *n* bytes of memory, and then copies [first,last) into it.

Definition at line 1047 of file stl_vector.h.

Referenced by std::vector< _Tp, _Alloc >::operator=().

5.730.3.2 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector<_Tp, _Alloc>::M_range_check (size_type __n)
const [inline, protected]`

Safety check used only from [at\(\)](#).

Definition at line 714 of file `stl_vector.h`.

5.730.3.3 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator > void std::vector<_Tp,
_Alloc>::assign (_InputIterator __first, _InputIterator __last)
[inline]`

Assigns a range to a vector.

Parameters

first An input iterator.

last An input iterator.

This function fills a vector with copies of the elements in the range `[first,last)`.

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 427 of file `stl_vector.h`.

5.730.3.4 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector<_Tp, _Alloc>::assign (size_type __n, const
value_type & __val) [inline]`

Assigns a given value to a vector.

Parameters

n Number of elements to be assigned.

val Value to be assigned.

This function fills a vector with *n* copies of the given value. Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 410 of file `stl_vector.h`.

5.730.3.5 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::assign (initializer_list< value_type
> __l) [inline]`

Assigns an initializer list to a vector.

Parameters

l An [initializer_list](#).

This function fills a vector with copies of the elements in the initializer list *l*.

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 447 of file `std_vector.h`.

Referenced by `std::vector< std::sub_match< _Bi_iter >, _Allocator >::assign()`.

5.730.3.6 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::vector< _Tp, _Alloc >::at (size_type __n)
[inline]`

Provides access to the data contained in the vector.

Parameters

n The index of the element for which data should be accessed.

Returns

Read/write reference to data.

Exceptions

[std::out_of_range](#) If *n* is an invalid index.

This function provides for safer data access. The parameter is first checked that it is in the range of the vector. The function throws [out_of_range](#) if the check fails.

Definition at line 733 of file `std_vector.h`.

5.730.3.7 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::vector< _Tp, _Alloc >::at (size_type __n)
const [inline]`

Provides access to the data contained in the vector.

Parameters

n The index of the element for which data should be accessed.

Returns

Read-only (constant) reference to data.

Exceptions

[*std::out_of_range*](#) If *n* is an invalid index.

This function provides for safer data access. The parameter is first checked that it is in the range of the vector. The function throws [*out_of_range*](#) if the check fails.

Definition at line 751 of file `stl_vector.h`.

5.730.3.8 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::vector<_Tp, _Alloc>::back () const
[inline]`

Returns a read-only (constant) reference to the data at the last element of the vector.

Definition at line 786 of file `stl_vector.h`.

5.730.3.9 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::vector<_Tp, _Alloc>::back () [inline]`

Returns a read/write reference to the data at the last element of the vector.

Definition at line 778 of file `stl_vector.h`.

Referenced by `std::piecewise_linear_distribution<_RealType>::max()`, and `std::piecewise_constant_distribution<_RealType>::max()`.

5.730.3.10 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_iterator std::vector<_Tp, _Alloc>::begin () const
[inline]`

Returns a read-only (constant) iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Reimplemented in `std::match_results<_Bi_iter, _Allocator>`, `std::match_results<_Bi_iter>`, and `std::match_results<_FwdIterT, _Alloc>`.

Definition at line 470 of file `stl_vector.h`.

5.730.3.11 **template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::vector< _Tp, _Alloc >::begin () [inline]**

Returns a read/write iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Definition at line 461 of file stl_vector.h.

Referenced by `std::vector< _Tp, _Alloc >::emplace()`, `std::vector< _Tp, _Alloc >::insert()`, `__gnu_parallel::multiseq_partition()`, `__gnu_parallel::multiseq_selection()`, `__gnu_parallel::multiway_merge_exact_splitting()`, `std::vector< _Tp, _Alloc >::operator=()`, `std::vector< _Tp, _Alloc >::operator==()`, and `std::vector< std::sub_match< _Bi_iter >, _Allocator >::vector()`.

5.730.3.12 **template<typename _Tp, typename _Alloc = std::allocator<_Tp>> size_type std::vector< _Tp, _Alloc >::capacity () const [inline]**

Returns the total number of elements that the vector can hold before needing to allocate more memory.

Definition at line 648 of file stl_vector.h.

Referenced by `std::vector< _Tp, _Alloc >::operator=()`.

5.730.3.13 **template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::vector< _Tp, _Alloc >::cbegin () const [inline]**

Returns a read-only (constant) iterator that points to the first element in the vector. Iteration is done in ordinary element order.

Reimplemented in `std::match_results< _Bi_iter, _Allocator >`, `std::match_results< _Bi_iter >`, and `std::match_results< _FwdIterT, _Alloc >`.

Definition at line 534 of file stl_vector.h.

5.730.3.14 **template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::vector< _Tp, _Alloc >::cend () const [inline]**

Returns a read-only (constant) iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

Reimplemented in `std::match_results< _Bi_iter, _Allocator >`, `std::match_results< _Bi_iter >`, and `std::match_results< _FwdIterT, _Alloc >`.

Definition at line 543 of file stl_vector.h.

5.730.3.15 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector<_Tp, _Alloc>::clear () [inline]`

Erases all the elements. Note that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 1037 of file `stl_vector.h`.

5.730.3.16 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::vector<_Tp, _Alloc>::rbegin ()
const [inline]`

Returns a read-only (constant) reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

Definition at line 552 of file `stl_vector.h`.

5.730.3.17 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::vector<_Tp, _Alloc>::rend () const
[inline]`

Returns a read-only (constant) reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

Definition at line 561 of file `stl_vector.h`.

5.730.3.18 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
_Tp* std::vector<_Tp, _Alloc>::data () [inline]`

Returns a pointer such that [`data()`, `data() + size()`) is a valid range. For a non-empty vector, `data() == &front()`.

Definition at line 801 of file `stl_vector.h`.

5.730.3.19 `template<typename _Tp, typename _Alloc> template<typename...
_Args> vector<_Tp, _Alloc>::iterator std::vector<_Tp, _Alloc>
>::emplace (iterator __position, _Args &&... __args)`

Inserts an object in vector before specified iterator.

Parameters

position An iterator into the vector.

args Arguments.

Returns

An iterator that points to the inserted data.

This function will insert an object of type `T` constructed with `T(std::forward<Args>(args)...) before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using std::list.`

Definition at line 272 of file `vector.tcc`.

References `std::vector< _Tp, _Alloc >::begin()`, and `std::vector< _Tp, _Alloc >::end()`.

5.730.3.20 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> bool std::vector< _Tp, _Alloc >::empty () const [inline]`

Returns true if the vector is empty. (Thus [begin\(\)](#) would equal [end\(\)](#).)

Reimplemented in [std::match_results< _Bi_iter, _Allocator >](#), [std::match_results< _-Bi_iter >](#), and [std::match_results< _FwdIterT, _Alloc >](#).

Definition at line 657 of file `stl_vector.h`.

5.730.3.21 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> iterator std::vector< _Tp, _Alloc >::end () [inline]`

Returns a read/write iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

Definition at line 479 of file `stl_vector.h`.

Referenced by `std::vector< _Tp, _Alloc >::emplace()`, `std::vector< _Tp, _-Alloc >::erase()`, `std::vector< _Tp, _Alloc >::insert()`, `__gnu_parallel::multiseq_partition()`, `__gnu_parallel::multiseq_selection()`, `__gnu_parallel::multiway_merge_exact_splitting()`, `std::vector< _Tp, _Alloc >::operator=()`, `std::operator==()`, and `std::vector< std::sub_match< _Bi_iter >, _Allocator >::vector()`.

5.730.3.22 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> const_iterator std::vector< _Tp, _Alloc >::end () const [inline]`

Returns a read-only (constant) iterator that points one past the last element in the vector. Iteration is done in ordinary element order.

Reimplemented in [std::match_results< _Bi_iter, _Allocator >](#), [std::match_results< _-Bi_iter >](#), and [std::match_results< _FwdIterT, _Alloc >](#).

Definition at line 488 of file `stl_vector.h`.

5.730.3.23 `template<typename _Tp , typename _Alloc > vector< _Tp, _Alloc >::iterator std::vector< _Tp, _Alloc >::erase (iterator __position)`

Remove element at given position.

Parameters

position Iterator pointing to element to be erased.

Returns

An iterator pointing to the next element (or `end()`).

This function will erase the element at the given position and thus shorten the vector by one.

Note This operation could be expensive and if it is frequently used the user should consider using `std::list`. The user is also cautioned that this function only erases the element, and that if the element is itself a pointer, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 134 of file `vector.tcc`.

References `std::vector< _Tp, _Alloc >::end()`.

5.730.3.24 `template<typename _Tp , typename _Alloc > vector< _Tp, _Alloc >::iterator std::vector< _Tp, _Alloc >::erase (iterator __first, iterator __last)`

Remove a range of elements.

Parameters

first Iterator pointing to the first element to be erased.

last Iterator pointing to one past the last element to be erased.

Returns

An iterator pointing to the element pointed to by *last* prior to erasing (or `end()`).

This function will erase the elements in the range `[first,last)` and shorten the vector accordingly.

Note This operation could be expensive and if it is frequently used the user should consider using `std::list`. The user is also cautioned that this function only erases the elements, and that if the elements themselves are pointers, the pointed-to memory is not touched in any way. Managing the pointer is the user's responsibility.

Definition at line 146 of file `vector.tcc`.

References `std::vector< _Tp, _Alloc >::end()`.

5.730.3.25 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::vector< _Tp, _Alloc >::front () [inline]`

Returns a read/write reference to the data at the first element of the vector.

Definition at line 762 of file stl_vector.h.

Referenced by `std::piecewise_linear_distribution< _RealType >::min()`, and `std::piecewise_constant_distribution< _RealType >::min()`.

5.730.3.26 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::vector< _Tp, _Alloc >::front () const
[inline]`

Returns a read-only (constant) reference to the data at the first element of the vector.

Definition at line 770 of file stl_vector.h.

5.730.3.27 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
template<typename _InputIterator > void std::vector< _Tp,
_Alloc >::insert (iterator __position, _InputIterator __first,
_InputIterator __last) [inline]`

Inserts a range into the vector.

Parameters

position An iterator into the vector.

first An input iterator.

last An input iterator.

This function will insert copies of the data in the range [first,last) into the vector before the location specified by *pos*.

Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using [std::list](#).

Definition at line 960 of file stl_vector.h.

5.730.3.28 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
iterator std::vector< _Tp, _Alloc >::insert (iterator __position,
value_type && __x) [inline]`

Inserts given rvalue into vector before specified iterator.

Parameters

position An iterator into the vector.
x Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given rvalue before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using [std::list](#).

Definition at line 906 of file `stl_vector.h`.

```
5.730.3.29  template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
             void std::vector< _Tp, _Alloc >::insert ( iterator __position,
             initializer_list< value_type > __l ) [inline]
```

Inserts an [initializer_list](#) into the vector.

Parameters

position An iterator into the vector.
l An [initializer_list](#).

This function will insert copies of the data in the [initializer_list](#) *l* into the vector before the location specified by *position*.

Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using [std::list](#).

Definition at line 923 of file `stl_vector.h`.

Referenced by `std::vector< std::sub_match< _Bi_iter >, _Allocator >::insert()`.

```
5.730.3.30  template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
             void std::vector< _Tp, _Alloc >::insert ( iterator __position,
             size_type __n, const value_type & __x ) [inline]
```

Inserts a number of copies of given data into the vector.

Parameters

position An iterator into the vector.
n Number of elements to be inserted.
x Data to be inserted.

This function will insert a specified number of copies of the given data before the location specified by *position*.

Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using [std::list](#).

Definition at line 941 of file stl_vector.h.

5.730.3.31 `template<typename _Tp, typename _Alloc > vector< _Tp, _Alloc
>::iterator std::vector< _Tp, _Alloc >::insert (iterator __position,
const value_type & __x)`

Inserts given value into vector before specified iterator.

Parameters

position An iterator into the vector.

x Data to be inserted.

Returns

An iterator that points to the inserted data.

This function will insert a copy of the given value before the specified location. Note that this kind of operation could be expensive for a vector and if it is frequently used the user should consider using [std::list](#).

Definition at line 107 of file vector.tcc.

References `std::vector< _Tp, _Alloc >::begin()`, and `std::vector< _Tp, _Alloc >::end()`.

5.730.3.32 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
size_type std::vector< _Tp, _Alloc >::max_size () const
[inline]`

Returns the [size\(\)](#) of the largest possible vector.

Reimplemented in [std::match_results< _Bi_iter, _Allocator >](#), [std::match_results< _Bi_iter >](#), and [std::match_results< _FwdIterT, _Alloc >](#).

Definition at line 573 of file stl_vector.h.

5.730.3.33 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
vector& std::vector< _Tp, _Alloc >::operator= (vector< _Tp,
_Alloc > && __x) [inline]`

Vector move assignment operator.

Parameters

x A vector of identical element and allocator types.

The contents of *x* are moved into this vector (without copying). *x* is a valid, but unspecified vector.

Definition at line 371 of file `stl_vector.h`.

5.730.3.34 `template<typename _Tp, typename _Alloc > vector< _Tp, _Alloc > & std::vector< _Tp, _Alloc >::operator= (const vector< _Tp, _Alloc > & __x)`

Vector assignment operator.

Parameters

x A vector of identical element and allocator types.

All the elements of *x* are copied, but any extra memory in *x* (for fast expansion) will not be copied. Unlike the copy constructor, the allocator object is not copied.

Definition at line 157 of file `vector.tcc`.

References `std::_Destroy()`, `std::vector< _Tp, _Alloc >::_M_allocate_and_copy()`, `std::vector< _Tp, _Alloc >::begin()`, `std::vector< _Tp, _Alloc >::capacity()`, `std::vector< _Tp, _Alloc >::end()`, and `std::vector< _Tp, _Alloc >::size()`.

5.730.3.35 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>> vector& std::vector< _Tp, _Alloc >::operator= (initializer_list< value_type > __l) [inline]`

Vector list assignment operator.

Parameters

l An [initializer_list](#).

This function fills a vector with copies of the elements in the initializer list *l*.

Note that the assignment completely changes the vector and that the resulting vector's size is the same as the number of elements assigned. Old data may be lost.

Definition at line 392 of file `stl_vector.h`.

5.730.3.36 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reference std::vector< _Tp, _Alloc >::operator[] (size_type
__n) const [inline]`

Subscript access to the data contained in the vector.

Parameters

n The index of the element for which data should be accessed.

Returns

Read-only (constant) reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and [out_of_range](#) lookups are not defined. (For checked lookups see [at\(\)](#).)

Definition at line 708 of file `std_vector.h`.

5.730.3.37 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reference std::vector< _Tp, _Alloc >::operator[] (size_type __n)
[inline]`

Subscript access to the data contained in the vector.

Parameters

n The index of the element for which data should be accessed.

Returns

Read/write reference to data.

This operator allows for easy, array-style, data access. Note that data access with this operator is unchecked and [out_of_range](#) lookups are not defined. (For checked lookups see [at\(\)](#).)

Definition at line 693 of file `std_vector.h`.

5.730.3.38 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::pop_back () [inline]`

Removes last element.

This is a typical stack operation. It shrinks the vector by one.

Note that no data is returned, and if the last element's data is needed, it should be retrieved before [pop_back\(\)](#) is called.

Definition at line 855 of file stl_vector.h.

5.730.3.39 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector<_Tp, _Alloc>::push_back (const value_type &
__x) [inline]`

Add data to the end of the vector.

Parameters

x Data to be added.

This is a typical stack operation. The function creates an element at the end of the vector and assigns the given data to it. Due to the nature of a vector this operation can be done in constant time if the vector has preallocated space available.

Definition at line 824 of file stl_vector.h.

Referenced by `__gnu_parallel::multiseq_partition()`, and `__gnu_parallel::multiseq_selection()`.

5.730.3.40 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reverse_iterator std::vector<_Tp, _Alloc>::rbegin ()
[inline]`

Returns a read/write reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

Definition at line 497 of file stl_vector.h.

5.730.3.41 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::vector<_Tp, _Alloc>::rbegin () const
[inline]`

Returns a read-only (constant) reverse iterator that points to the last element in the vector. Iteration is done in reverse element order.

Definition at line 506 of file stl_vector.h.

5.730.3.42 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
reverse_iterator std::vector<_Tp, _Alloc>::rend () [inline]`

Returns a read/write reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

Definition at line 515 of file stl_vector.h.

5.730.3.43 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
const_reverse_iterator std::vector< _Tp, _Alloc >::rend () const
[inline]`

Returns a read-only (constant) reverse iterator that points to one before the first element in the vector. Iteration is done in reverse element order.

Definition at line 524 of file stl_vector.h.

5.730.3.44 `template<typename _Tp , typename _Alloc > void std::vector<
_Tp, _Alloc >::reserve (size_type __n)`

Attempt to preallocate enough memory for specified number of elements.

Parameters

n Number of elements required.

Exceptions

std::length_error If *n* exceeds `max_size()`.

This function attempts to reserve enough memory for the vector to hold the specified number of elements. If the number requested is more than `max_size()`, `length_error` is thrown.

The advantage of this function is that if optimal code is a necessity and the user can determine the number of elements that will be required, the user can reserve the memory in advance, and thus prevent a possible reallocation of memory and copying of vector data.

Definition at line 65 of file vector.tcc.

References `std::_Destroy()`.

5.730.3.45 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::resize (size_type __new_size,
const value_type & __x) [inline]`

Resizes the vector to the specified number of elements.

Parameters

new_size Number of elements the vector should contain.

x Data with which new elements should be populated.

This function will resize the vector to the specified number of elements. If the number is smaller than the vector's current size the vector is truncated, otherwise the vector is extended and new elements are populated with given data.

Definition at line 607 of file `stl_vector.h`.

5.730.3.46 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector<_Tp, _Alloc>::resize (size_type __new_size)
[inline]`

Resizes the vector to the specified number of elements.

Parameters

new_size Number of elements the vector should contain.

This function will resize the vector to the specified number of elements. If the number is smaller than the vector's current size the vector is truncated, otherwise default constructed elements are appended.

Definition at line 587 of file `stl_vector.h`.

Referenced by `__gnu_parallel::__shrink_and_double()`, `__gnu_parallel::multiway_merge_exact_splitting()`, and `__gnu_parallel::parallel_sort_mwms()`.

5.730.3.47 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector<_Tp, _Alloc>::shrink_to_fit () [inline]`

A non-binding request to reduce [capacity\(\)](#) to [size\(\)](#).

Definition at line 639 of file `stl_vector.h`.

5.730.3.48 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
size_type std::vector<_Tp, _Alloc>::size () const [inline]`

Returns the number of elements in the vector.

Reimplemented in [std::match_results<_Bi_iter, _Allocator>](#), [std::match_results<_Bi_iter>](#), and [std::match_results<_FwdIterT, _Alloc>](#).

Definition at line 568 of file `stl_vector.h`.

Referenced by `__gnu_parallel::__shrink()`, `__gnu_parallel::__shrink_and_double()`, `__gnu_parallel::list_partition()`, `std::discrete_distribution<_IntType>::max()`, `std::vector<_Tp, _Alloc>::operator=()`, and `std::operator==()`.

5.730.3.49 `template<typename _Tp, typename _Alloc = std::allocator<_Tp>>
void std::vector< _Tp, _Alloc >::swap (vector< _Tp, _Alloc > &
__x) [inline]`

Swaps data with another vector.

Parameters

x A vector of the same element and allocator types.

This exchanges the elements between two vectors in constant time. (Three pointers, so it should be quite fast.) Note that the global [std::swap\(\)](#) function is specialized such that `std::swap(v1,v2)` will feed to this function.

Definition at line 1017 of file `stl_vector.h`.

Referenced by `std::swap()`.

5.731.1 Detailed Description

`template<typename _Alloc> class std::vector< bool, _Alloc >`

A specialization of vector for booleans which offers fixed time access to individual elements in any order. Note that `vector<bool>` does not actually meet the requirements for being a container. This is because the reference and pointer types are not really references and pointers to bool. See DR96 for details.

See also

[vector](#) for function documentation.

In some terminology a vector can be described as a dynamic C-style array, it offers fast and efficient access to individual elements in any order and saves the user from worrying about memory and size allocation. Subscripting (`[]`) access is also provided as with C-style arrays.

Definition at line 474 of file `stl_bvector.h`.

The documentation for this class was generated from the following files:

- [stl_bvector.h](#)
- [vector.tcc](#)

5.733.1 Detailed Description

template<typename _RealType = double> class std::weibull_distribution< _RealType >

A [weibull_distribution](#) random number distribution. The formula for the normal probability density function is:

$$p(x|\alpha, \beta) = \frac{\alpha}{\beta} \left(\frac{x}{\beta}\right)^{\alpha-1} \exp\left(-\left(\frac{x}{\beta}\right)^{\alpha}\right)$$

Definition at line 4338 of file random.h.

5.733.2 Member Typedef Documentation

5.733.2.1 template<typename _RealType = double> typedef _RealType std::weibull_distribution< _RealType >::result_type

The type of the range of the distribution.

Definition at line 4345 of file random.h.

5.733.3 Member Function Documentation

5.733.3.1 `template<typename _RealType = double> _RealType
std::weibull_distribution< _RealType >::a () const [inline]`

Return the a parameter of the distribution.

Definition at line 4396 of file random.h.

5.733.3.2 `template<typename _RealType = double> _RealType
std::weibull_distribution< _RealType >::b () const [inline]`

Return the b parameter of the distribution.

Definition at line 4403 of file random.h.

5.733.3.3 `template<typename _RealType = double> result_type
std::weibull_distribution< _RealType >::max () const [inline]`

Returns the least upper bound value of the distribution.

Definition at line 4432 of file random.h.

5.733.3.4 `template<typename _RealType = double> result_type
std::weibull_distribution< _RealType >::min () const [inline]`

Returns the greatest lower bound value of the distribution.

Definition at line 4425 of file random.h.

5.733.3.5 `template<typename _RealType = double> template<typename
_UniformRandomNumberGenerator > result_type
std::weibull_distribution< _RealType >::operator() (
_UniformRandomNumberGenerator & __urng) [inline]`

Generating functions.

Definition at line 4440 of file random.h.

6.1.1 Detailed Description

Parallel STL function calls corresponding to the [stl_algo.h](#) header. The functions defined here mainly do case switches and call the actual parallelized versions in other files. Inlining policy: Functions that basically only contain one function call, are declared inline. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file [algo.h](#).

6.2 `algbase.h` File Reference

Parallel STL function calls corresponding to the [stl_algbase.h](#) header. The functions defined here mainly do case switches and call the actual parallelized versions in other files. Inlining policy: Functions that basically only contain one function call, are declared inline. This file is a GNU parallel extension to the Standard C++ Library.

### 6.7.1 Detailed Description

This file is a GNU parallel extension to the Standard C++ Library.

Definition in file [parallel/algorithmfwd.h](#).

## 6.8 allocator.h File Reference

### Classes

- class [std::allocator<\\_Tp>](#)  
*The standard allocator, as per [20.4].*  
*Further details: <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt04ch11.html>.*
- class [std::allocator<void>](#)  
*[allocator<void>](#) specialization.*
- struct [std::allocator\\_arg\\_t](#)  
*[[allocator.tag](#)]*
- struct [std::uses\\_allocator<\\_Tp, \\_Alloc>](#)  
*[[allocator.uses.trait](#)]*

### Namespaces

- namespace [std](#)

### Functions

- `template<typename _T1, typename _T2 >  
bool std::operator!= (const allocator<_T1> &, const allocator<_T2> &)`
- `template<typename _Tp >  
bool std::operator!= (const allocator<_Tp> &, const allocator<_Tp> &)`
- `template<typename _T1, typename _T2 >  
bool std::operator== (const allocator<_T1> &, const allocator<_T2> &)`
- `template<typename _Tp >  
bool std::operator== (const allocator<_Tp> &, const allocator<_Tp> &)`

### Variables

- static const allocator\_arg\_t **std::allocator\_arg**

### 6.8.1 Detailed Description

This is an internal header file, included by other library headers. You should not attempt to use it directly.

Definition in file [allocator.h](#).

## 6.9 array File Reference

### 6.9.1 Detailed Description

This is a Standard C++ Library header.

Definition in file [array](#).

## 6.10 array File Reference

### Classes

- struct [std::tr1::array< \\_Tp, \\_Nm >](#)  
*A standard container for storing a fixed size sequence of elements.*

### Namespaces

- namespace [std](#)
- namespace [std::tr1](#)

### Functions

- `template<std::size_t _Int, typename _Tp, std::size_t _Nm>  
_Tp & std::tr1::get (array< _Tp, _Nm > &__arr)`

`RAIter > **__tls, _Compare &__comp, _ThreadIndex __iam, bool __wait)`

### 6.22.1 Detailed Description

Implementation of a dynamically load-balanced parallel quicksort. It works in-place and needs only logarithmic extra memory. The algorithm is similar to the one proposed in

P. Tsigas and Y. Zhang. A simple, fast parallel implementation of quicksort and its performance evaluation on SUN enterprise 10000. In 11th Euromicro Conference on Parallel, Distributed and Network-Based Processing, page 372, 2003.

This file is a GNU parallel extension to the Standard C++ Library.

Definition in file [balanced\\_quicksort.h](#).

## 6.23 base.h File Reference

Sequential helper functions. This file is a GNU parallel extension to the Standard C++ Library.

## Classes

- class [\\_\\_gnu\\_parallel::\\_\\_binder1st](#)< \_Operation, \_FirstArgumentType, \_-  
[SecondArgumentType, \\_ResultType >](#)

Similar to [`std::binder1st`](#), but giving the argument types explicitly.

- class [`\_\_gnu\_parallel::\_\_binder2nd`](#)< [`\_Operation`](#), [`\_FirstArgumentType`](#), [`\_SecondArgumentType`](#), [`\_ResultType`](#) >

Similar to [`std::binder2nd`](#), but giving the argument types explicitly.

- class [`\_\_gnu\_parallel::\_\_unary\_negate`](#)< [`\_Predicate`](#), [`argument\_type`](#) >

Similar to [`std::unary\_negate`](#), but giving the argument types explicitly.

- class [`\_\_gnu\_parallel::\_EqualFromLess`](#)< [`\_T1`](#), [`\_T2`](#), [`\_Compare`](#) >

Constructs predicate for equality from strict weak ordering predicate.

- struct [`\_\_gnu\_parallel::\_EqualTo`](#)< [`\_T1`](#), [`\_T2`](#) >

Similar to [`std::equal\_to`](#), but allows two different types.

- struct [`\_\_gnu\_parallel::\_Less`](#)< [`\_T1`](#), [`\_T2`](#) >

Similar to [`std::less`](#), but allows two different types.

- struct [`\_\_gnu\_parallel::\_Multiplies`](#)< [`\_Tp1`](#), [`\_Tp2`](#), [`\_Result`](#) >

Similar to [`std::multiplies`](#), but allows two different types.

- struct [`\_\_gnu\_parallel::\_Plus`](#)< [`\_Tp1`](#), [`\_Tp2`](#), [`\_Result`](#) >

Similar to [`std::plus`](#), but allows two different types.

- class [`\_\_gnu\_parallel::\_PseudoSequence`](#)< [`\_Tp`](#), [`\_DifferenceTp`](#) >

Sequence that conceptually consists of multiple copies of the same element. The copies are not stored explicitly, of course.

- class [`\_\_gnu\_parallel::\_PseudoSequenceIterator`](#)< [`\_Tp`](#), [`\_DifferenceTp`](#) >

[`\_Iterator`](#) associated with [`\_\_gnu\_parallel::\_PseudoSequence`](#). If features the usual random-access iterator functionality.

## Namespaces

This is an internal header file, included by other library headers. You should not attempt to use it directly.

Definition in file [basic\\_ios.h](#).

## 6.27 `basic_ios.tcc` File Reference

### Namespaces

- namespace `std`

### 6.27.1 Detailed Description

This is an internal header file, included by other library headers. You should not attempt to use it directly.

Definition in file `basic_ios.tcc`.

## 6.28 `basic_iterator.h` File Reference

Includes the original header files concerned with iterators except for stream iterators. This file is a GNU parallel extension to the Standard C++ Library.

### 6.28.1 Detailed Description

Includes the original header files concerned with iterators except for stream iterators. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file `basic_iterator.h`.

## 6.29 `basic_string.h` File Reference

### Classes

- class `std::basic_string<_CharT, _Traits, _Alloc>`  
*Managing sequences of characters and character-like objects.*
- struct `std::hash<string>`  
*`std::hash` specialization for `string`.*
- struct `std::hash<u16string>`  
*`std::hash` specialization for `u16string`.*
- struct `std::hash<u32string>`  
*`std::hash` specialization for `u32string`.*

- struct [std::hash<wstring>](#)  
[std::hash](#) specialization for *wstring*.

- typedef \_\_pthread\_mutex\_t **std::\_\_c\_lock**

### 6.42.1 Detailed Description

This is an internal header file, included by other library headers. You should not attempt to use it directly.

Definition in file [c++io.h](#).

## 6.43 c++locale.h File Reference

### Namespaces

- namespace [std](#)

### Defines

- #define **\_GLIBCXX\_C\_LOCALE\_GNU**
- #define **\_GLIBCXX\_NUM\_CATEGORIES**

### Typedefs

- typedef \_\_locale\_t **std::\_\_c\_locale**

### Functions

- int **std::\_\_convert\_from\_v** (const \_\_c\_locale &\_\_cloc \_\_attribute\_\_((\_\_unused\_\_)), char \*\_\_out, const int \_\_size \_\_attribute\_\_((\_\_unused\_\_)), const char \*\_\_fmt,...)

### 6.43.1 Detailed Description

This is an internal header file, included by other library headers. You should not attempt to use it directly.

Definition in file [c++locale.h](#).

## 6.44 `c++locale_internal.h` File Reference

### 6.44.1 Detailed Description

This is an internal header file, included by other library headers. You should not attempt to use it directly.

Definition in file [c++locale\\_internal.h](#).

## 6.45 `cassert` File Reference

### 6.45.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `assert.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file [cassert](#).

## 6.46 `ccomplex` File Reference

### 6.46.1 Detailed Description

This is a Standard C++ Library header.

Definition in file [ccomplex](#).

## 6.47 `ccomplex` File Reference

### 6.47.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file [tr1/ccomplex](#).

## 6.48 cctype File Reference

### Namespaces

- namespace [std](#)

#### 6.48.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `ctype.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file [cctype](#).

## 6.49 cctype File Reference

### Defines

- `#define _GLIBCXX_BEGIN_NAMESPACE_TR1`
- `#define _GLIBCXX_END_NAMESPACE_TR1`
- `#define _GLIBCXX_TR1`

#### 6.49.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file [tr1/cctype](#).

## 6.50 cctype File Reference

#### 6.50.1 Detailed Description

This is an internal header file, included by other library headers. You should not attempt to use it directly.

Definition in file [tr1\\_impl/cctype](#).

## 6.51 cerrno File Reference

### Defines

- `#define errno`

### 6.51.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `errno.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file [cerrno](#).

## 6.52 cfenv File Reference

### 6.52.1 Detailed Description

This is a Standard C++ Library header.

Definition in file [cfenv](#).

## 6.53 cfenv File Reference

### Defines

- `#define _GLIBCXX_BEGIN_NAMESPACE_TR1`
- `#define _GLIBCXX_END_NAMESPACE_TR1`
- `#define _GLIBCXX_TR1`

### 6.53.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file [tr1/cfenv](#).

## 6.54 `cfenv` File Reference

### 6.54.1 Detailed Description

This is an internal header file, included by other library headers. You should not attempt to use it directly.

Definition in file [tr1\\_impl/cfenv](#).

## 6.55 `cfloat` File Reference

### Defines

- `#define DECIMAL_DIG`
- `#define FLT_EVAL_METHOD`

### 6.55.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `float.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file [cfloat](#).

## 6.56 `cfloat` File Reference

### Defines

- `#define DECIMAL_DIG`
- `#define FLT_EVAL_METHOD`

### 6.56.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file [tr1/cfloat](#).

## 6.57 char\_traits.h File Reference

### Classes

- struct [\\_\\_gnu\\_cxx::\\_Char\\_types<\\_CharT>](#)

### 6.59.1 Detailed Description

This is a Standard C++ Library header.

Definition in file [chrono](#).

## 6.60 cinttypes File Reference

### 6.60.1 Detailed Description

This is a Standard C++ Library header.

Definition in file [cinttypes](#).

## 6.61 cinttypes File Reference

### Defines

- `#define _GLIBCXX_BEGIN_NAMESPACE_TR1`
- `#define _GLIBCXX_END_NAMESPACE_TR1`
- `#define _GLIBCXX_TR1`

### 6.61.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file [tr1/cinttypes](#).

## 6.62 cinttypes File Reference

### 6.62.1 Detailed Description

This is an internal header file, included by other library headers. You should not attempt to use it directly.

Definition in file [tr1\\_impl/cinttypes](#).

## 6.63 ciso646 File Reference

### 6.63.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the \*.h implementation files.

This is the C++ version of the Standard C Library header `iso646.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file [ciso646](#).

## 6.64 climits File Reference

### Defines

- `#define LLONG_MAX`
- `#define LLONG_MIN`
- `#define ULLONG_MAX`

### 6.64.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the \*.h implementation files.

This is the C++ version of the Standard C Library header `limits.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file [climits](#).

## 6.65 `climits` File Reference

### Defines

- `#define LLONG_MAX`
- `#define LLONG_MIN`
- `#define ULLONG_MAX`

### 6.65.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file [tr1/climits](#).

## 6.66 `locale` File Reference

### Namespaces

- namespace [std](#)

### 6.66.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `locale.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file [clocale](#).

- `void __gnu_parallel::__yield` ()

### 6.73.1 Detailed Description

Compatibility layer, mostly concerned with atomic operations. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file [parallel/compatibility.h](#).

## 6.74 `compiletime_settings.h` File Reference

Defines on options concerning debugging and performance, at compile-time. This file is a GNU parallel extension to the Standard C++ Library.

### Defines

- `#define _GLIBCXX_ASSERTIONS`
- `#define _GLIBCXX_CALL(__n)`
- `#define _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_L1`
- `#define _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_TLB`
- `#define _GLIBCXX_SCALE_DOWN_FPU`
- `#define _GLIBCXX_VERBOSE_LEVEL`

### 6.74.1 Detailed Description

Defines on options concerning debugging and performance, at compile-time. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file [compiletime\\_settings.h](#).

## 6.74.2 Define Documentation

### 6.74.2.1 `#define _GLIBCXX_ASSERTIONS`

Switch on many `_GLIBCXX_PARALLEL_ASSERTIONS` in parallel code. Should be switched on only locally.

Definition at line 61 of file `compiletime_settings.h`.

Referenced by `__gnu_parallel::__qsb_local_sort_with_helping()`.

### 6.74.2.2 `#define _GLIBCXX_CALL( __n )`

Macro to produce log message when entering a function.

#### Parameters

`__n` Input size.

#### See also

[\\_GLIBCXX\\_VERBOSE\\_LEVEL](#)

Definition at line 44 of file `compiletime_settings.h`.

Referenced by `__gnu_parallel::__find_template()`, `__gnu_parallel::__for_each_template_random_access_workstealing()`, `__gnu_parallel::__merge_advance()`, `__gnu_parallel::__parallel_nth_element()`, `__gnu_parallel::__parallel_partial_sum()`, `__gnu_parallel::__parallel_partition()`, `__gnu_parallel::__parallel_random_shuffle_drs()`, `__gnu_parallel::__parallel_sort()`, `__gnu_parallel::__parallel_sort_qs()`, `__gnu_parallel::__parallel_sort_qsb()`, `__gnu_parallel::__parallel_unique_copy()`, `__gnu_parallel::__search_template()`, `__gnu_parallel::__sequential_multiway_merge()`, `__gnu_parallel::__multiseq_partition()`, `__gnu_parallel::__multiseq_selection()`, `__gnu_parallel::__multiway_merge()`, `__gnu_parallel::__multiway_merge_3_variant()`, `__gnu_parallel::__multiway_merge_4_variant()`, `__gnu_parallel::__multiway_merge_loser_tree()`, `__gnu_parallel::__multiway_merge_loser_tree_sentinel()`, `__gnu_parallel::__multiway_merge_loser_tree_unguarded()`, `__gnu_parallel::__multiway_merge_sentinels()`, `__gnu_parallel::__parallel_multiway_merge()`, and `__gnu_parallel::__parallel_sort_mwms()`.

### 6.74.2.3 `#define _GLIBCXX_RANDOM_SHUFFLE_CONSIDER_L1`

Switch on many `_GLIBCXX_PARALLEL_ASSERTIONS` in parallel code. Consider the size of the L1 cache for `gnu_parallel::__parallel_random_shuffle()`.

Definition at line 68 of file `compiletime_settings.h`.

**6.74.2.4 #define \_GLIBCXX\_RANDOM\_SHUFFLE\_CONSIDER\_TLB**

Switch on many `_GLIBCXX_PARALLEL_ASSERTions` in parallel code. Consider the size of the TLB for `gnu_parallel::__parallel_random_shuffle()`.

Definition at line 74 of file `completetime_settings.h`.

**6.74.2.5 #define \_GLIBCXX\_SCALE\_DOWN\_FPU**

Use floating-point scaling instead of modulo for mapping random numbers to a range. This can be faster on certain CPUs.

Definition at line 55 of file `completetime_settings.h`.

**6.74.2.6 #define \_GLIBCXX\_VERBOSE\_LEVEL**

Determine verbosity level of the parallel mode. Level 1 prints a message each time a parallel-mode function is entered.

Definition at line 37 of file `completetime_settings.h`.

`__gnu_cxx::__promote< _Tp >::__type std::tr1::imag (_Tp)`
- `template<typename _Tp >`  
`__gnu_cxx::__promote< _Tp >::__type std::tr1::norm (_Tp __x)`
- `template<typename _Tp, typename _Up >`  
`std::complex< typename __gnu_cxx::__promote_2< _Tp, _Up >::__type >`  
`std::tr1::pow (const std::complex< _Tp > &__x, const _Up &__y)`
- `template<typename _Tp, typename _Up >`  
`std::complex< typename __gnu_cxx::__promote_2< _Tp, _Up >::__type >`  
`std::tr1::pow (const _Tp &__x, const std::complex< _Up > &__y)`
- `template<typename _Tp, typename _Up >`  
`std::complex< typename __gnu_cxx::__promote_2< _Tp, _Up >::__type >`  
`std::tr1::pow (const std::complex< _Tp > &__x, const std::complex< _Up >`  
`&__y)`
- `template<typename _Tp >`  
`__gnu_cxx::__promote< _Tp >::__type std::tr1::real (_Tp __x)`

### 6.77.1 Detailed Description

This is an internal header file, included by other library headers. You should not attempt to use it directly.

Definition in file [tr1\\_impl/complex](#).

## 6.78 complex.h File Reference

### 6.78.1 Detailed Description

This is a Standard C++ Library header.

Definition in file [complex.h](#).

## 6.79 `concept_check.h` File Reference

### Defines

- `#define __glibcxx_class_requires(_a, _b)`
- `#define __glibcxx_class_requires2(_a, _b, _c)`
- `#define __glibcxx_class_requires3(_a, _b, _c, _d)`
- `#define __glibcxx_class_requires4(_a, _b, _c, _d, _e)`
- `#define __glibcxx_function_requires(...)`

### 6.79.1 Detailed Description

This is an internal header file, included by other library headers. You should not attempt to use it directly.

Definition in file [concept\\_check.h](#).

## 6.80 `concurrency.h` File Reference

### Classes

- class [\\_\\_gnu\\_cxx::\\_\\_scoped\\_lock](#)  
*Scoped lock idiom.*

### Namespaces

- namespace [\\_\\_gnu\\_cxx](#)

### Enumerations

- enum `_Lock_policy` { `_S_single`, `_S_mutex`, `_S_atomic` }

### Functions

- void `__gnu_cxx::__throw_concurrency_lock_error()`
- void `__gnu_cxx::__throw_concurrency_unlock_error()`

## Variables

- static const `_Lock_policy` `__gnu_cxx::__default_lock_policy`

### 6.80.1 Detailed Description

This is an internal header file, included by other library headers. You should not attempt to use it directly.

Definition in file [concurrency.h](#).

## 6.81 cond\_dealtor.hpp File Reference

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### Defines

- `#define PB_DS_COND_DEALTOR_CLASS_C_DEC`
- `#define PB_DS_COND_DEALTOR_CLASS_T_DEC`

### 6.81.1 Detailed Description

Contains a conditional deallocator.

Definition in file [cond\\_dealtor.hpp](#).

## 6.82 condition\_variable File Reference

### Classes

- class [std::condition\\_variable](#)  
*condition\_variable*
- class [std::condition\\_variable\\_any](#)  
*condition\_variable\_any*

## Namespaces

- namespace [std](#)

## Enumerations

- enum [std::cv\\_status](#) { **no\_timeout**, **timeout** }

### 6.82.1 Detailed Description

This is a Standard C++ Library header.

Definition in file [condition\\_variable](#).

## 6.83 constructors\_destructor\_fn\_imps.hpp File Reference

### Functions

- **PB\_DS\_CLASS\_NAME** ()
- template<typename T0 , typename T1 , typename T2 , typename T3 , typename T4 , typename T5 , typename T6 , typename T7 , typename T8 >  
**PB\_DS\_CLASS\_NAME** (T0 t0, T1 t1, T2 t2, T3 t3, T4 t4, T5 t5, T6 t6, T7 t7, T8 t8)
- template<typename T0 , typename T1 , typename T2 , typename T3 , typename T4 , typename T5 , typename T6 , typename T7 >  
**PB\_DS\_CLASS\_NAME** (T0 t0, T1 t1, T2 t2, T3 t3, T4 t4, T5 t5, T6 t6, T7 t7)
- template<typename T0 , typename T1 , typename T2 , typename T3 , typename T4 , typename T5 , typename T6 >  
**PB\_DS\_CLASS\_NAME** (T0 t0, T1 t1, T2 t2, T3 t3, T4 t4, T5 t5, T6 t6)
- template<typename T0 , typename T1 , typename T2 , typename T3 , typename T4 , typename T5 >  
**PB\_DS\_CLASS\_NAME** (T0 t0, T1 t1, T2 t2, T3 t3, T4 t4, T5 t5)
- template<typename T0 , typename T1 , typename T2 , typename T3 , typename T4 >  
**PB\_DS\_CLASS\_NAME** (T0 t0, T1 t1, T2 t2, T3 t3, T4 t4)
- template<typename T0 , typename T1 , typename T2 , typename T3 >  
**PB\_DS\_CLASS\_NAME** (T0 t0, T1 t1, T2 t2, T3 t3)
- template<typename T0 , typename T1 , typename T2 >  
**PB\_DS\_CLASS\_NAME** (T0 t0, T1 t1, T2 t2)
- template<typename T0 , typename T1 >  
**PB\_DS\_CLASS\_NAME** (T0 t0, T1 t1)

- `template<typename T0 >`  
`PB_DS_CLASS_NAME` (T0 t0)
- `PB_DS_CLASS_NAME` (const PB\_DS\_CLASS\_NAME &other)

### 6.83.1 Detailed Description

Contains `constructors_destructor_fn_imps` applicable to different containers.

Definition in file [constructors\\_destructor\\_fn\\_imps.hpp](#).

## 6.84 container\_base\_dispatch.hpp File Reference

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### 6.84.1 Detailed Description

Contains an associative container dispatching base.

Definition in file [container\\_base\\_dispatch.hpp](#).

## 6.85 cpp\_type\_traits.h File Reference

### Namespaces

- namespace [\\_\\_gnu\\_cxx](#)
- namespace [std](#)

### 6.85.1 Detailed Description

This is an internal header file, included by other library headers. You should not attempt to use it directly.

Definition in file [cpp\\_type\\_traits.h](#).

## 6.86 `cpu_defines.h` File Reference

### 6.86.1 Detailed Description

This is an internal header file, included by other library headers. You should not attempt to use it directly.

Definition in file [cpu\\_defines.h](#).

## 6.87 `csetjmp` File Reference

### Namespaces

- namespace [std](#)

### Defines

- #define `setjmp(env)`

### 6.87.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `setjmp.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file [csetjmp](#).

## 6.88 `csignal` File Reference

### Namespaces

- namespace [std](#)

### 6.88.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `signal.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file [csignal](#).

## 6.89 cstdarg File Reference

### Namespaces

- namespace [std](#)

### Defines

- #define `va_end(ap)`

#### 6.89.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `stdarg.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file [cstdarg](#).

## 6.90 cstdarg File Reference

#### 6.90.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file [tr1/cstdarg](#).

## 6.91 cstdbool File Reference

#### 6.91.1 Detailed Description

This is a Standard C++ Library header.

Definition in file [cstdbool](#).

## 6.92 cstdint File Reference

### 6.92.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file [tr1/cstdint](#).

## 6.93 cstdint File Reference

### 6.93.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the \*.h implementation files.

This is the C++ version of the Standard C Library header `stdint.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file [cstdint](#).

## 6.94 cstdint File Reference

### 6.94.1 Detailed Description

This is a Standard C++ Library header.

Definition in file [cstdint](#).

## 6.95 cstdint File Reference

### Defines

- `#define _GLIBCXX_BEGIN_NAMESPACE_TR1`
- `#define _GLIBCXX_END_NAMESPACE_TR1`
- `#define _GLIBCXX_TR1`

### 6.95.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file [tr1/cstdint](#).

## 6.96 cstdint File Reference

### Namespaces

- namespace [std](#)
- namespace [std::tr1](#)

#### 6.96.1 Detailed Description

This is an internal header file, included by other library headers. You should not attempt to use it directly.

Definition in file [tr1\\_impl/cstdint](#).

## 6.97 cstdio File Reference

### Namespaces

- namespace [std](#)

#### 6.97.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `stdio.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file [cstdio](#).

## 6.98 cstdio File Reference

### Defines

- `#define _GLIBCXX_BEGIN_NAMESPACE_TR1`
- `#define _GLIBCXX_END_NAMESPACE_TR1`
- `#define _GLIBCXX_TR1`

### 6.98.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file [tr1/cstdio](#).

## 6.99 cstdio File Reference

### Namespaces

- namespace [std](#)
- namespace [std::tr1](#)

### 6.99.1 Detailed Description

This is an internal header file, included by other library headers. You should not attempt to use it directly.

Definition in file [tr1\\_impl/cstdio](#).

## 6.100 cstdlib File Reference

### Namespaces

- namespace [std](#)

### Defines

- `#define EXIT_FAILURE`
- `#define EXIT_SUCCESS`

### Functions

- void **std::abort** (void) \_GLIBCXX\_NORETURN throw ()
- int **std::atexit** (void(\*)()) throw ()
- void **std::exit** (int) \_GLIBCXX\_NORETURN throw ()

### 6.100.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `stdlib.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file [cstdlib](#).

## 6.101 cstdlib File Reference

### Defines

- `#define _GLIBCXX_BEGIN_NAMESPACE_TR1`
- `#define _GLIBCXX_END_NAMESPACE_TR1`
- `#define _GLIBCXX_TR1`

### 6.101.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file [tr1/cstdlib](#).

## 6.102 cstdlib File Reference

### 6.102.1 Detailed Description

This is an internal header file, included by other library headers. You should not attempt to use it directly.

Definition in file [tr1\\_impl/cstdlib](#).

## 6.103 cstring File Reference

### Namespaces

- namespace [std](#)

## Functions

- void \* **std::memchr** (void \*\_\_s, int \_\_c, size\_t \_\_n)
- char \* **std::strchr** (char \*\_\_s, int \_\_n)
- char \* **std::strpbrk** (char \*\_\_s1, const char \*\_\_s2)
- char \* **std::strrchr** (char \*\_\_s, int \_\_n)
- char \* **std::strstr** (char \*\_\_s1, const char \*\_\_s2)

### 6.103.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the \*.h implementation files.

This is the C++ version of the Standard C Library header `string.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file [cstring](#).

## 6.104 ctgmath File Reference

### 6.104.1 Detailed Description

This is a Standard C++ Library header.

Definition in file [ctgmath](#).

## 6.105 ctgmath File Reference

### 6.105.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file [tr1/ctgmath](#).

## 6.106 ctime File Reference

## Namespaces

- namespace [std](#)

### 6.106.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `time.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file [ctime](#).

## 6.107 ctime File Reference

### 6.107.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file [tr1/ctime](#).

## 6.108 ctype\_base.h File Reference

### Classes

- struct [std::ctype\\_base](#)

*Base class for ctype.*

### Namespaces

- namespace [std](#)

### 6.108.1 Detailed Description

This is an internal header file, included by other library headers. You should not attempt to use it directly.

Definition in file [ctype\\_base.h](#).

## 6.109 ctype\_inline.h File Reference

### Namespaces

- namespace [std](#)

#### 6.109.1 Detailed Description

This is an internal header file, included by other library headers. You should not attempt to use it directly.

Definition in file [ctype\\_inline.h](#).

## 6.110 ctype\_noninline.h File Reference

#### 6.110.1 Detailed Description

This is an internal header file, included by other library headers. You should not attempt to use it directly.

Definition in file [ctype\\_noninline.h](#).

## 6.111 cwchar File Reference

### Namespaces

- namespace [std](#)

### Functions

- `wchar_t * std::wcschr (wchar_t *__p, wchar_t __c)`
- `wchar_t * std::wcpbrk (wchar_t *__s1, const wchar_t *__s2)`
- `wchar_t * std::wcsrchr (wchar_t *__p, wchar_t __c)`
- `wchar_t * std::wcsstr (wchar_t *__s1, const wchar_t *__s2)`
- `wchar_t * std::wmemchr (wchar_t *__p, wchar_t __c, size_t __n)`

#### 6.111.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the \*.h implementation files.

This is the C++ version of the Standard C Library header `wchar.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file [cwchar](#).

## 6.112 `wchar` File Reference

### Defines

- `#define _GLIBCXX_BEGIN_NAMESPACE_TR1`
- `#define _GLIBCXX_END_NAMESPACE_TR1`
- `#define _GLIBCXX_TR1`

### 6.112.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file [tr1/cwchar](#).

## 6.113 `wchar` File Reference

### Namespaces

- namespace [std](#)
- namespace [std::tr1](#)

### 6.113.1 Detailed Description

This is an internal header file, included by other library headers. You should not attempt to use it directly.

Definition in file [tr1\\_impl/cwchar](#).

## 6.114 `cwctype` File Reference

### Namespaces

- namespace [std](#)

## Defines

- `#define _GLIBCXX_CWCTYPE`

### 6.114.1 Detailed Description

This is a Standard C++ Library file. You should `#include` this file in your programs, rather than any of the `*.h` implementation files.

This is the C++ version of the Standard C Library header `wctype.h`, and its contents are (mostly) the same as that header, but are all contained in the namespace `std` (except for names which are defined as macros in C).

Definition in file [cwctype](#).

## 6.115 cwctype File Reference

### Defines

- `#define _GLIBCXX_BEGIN_NAMESPACE_TR1`
- `#define _GLIBCXX_END_NAMESPACE_TR1`
- `#define _GLIBCXX_TR1`

### 6.115.1 Detailed Description

This is a TR1 C++ Library header.

Definition in file [tr1/cwctype](#).

## 6.116 cwctype File Reference

### Namespaces

- namespace [std](#)
- namespace [std::tr1](#)

### 6.116.1 Detailed Description

This is an internal header file, included by other library headers. You should not attempt to use it directly.

Definition in file [tr1\\_impl/cwctype](#).

## 6.117 cxxabi-forced.h File Reference

### Classes

- class [\\_\\_cxxabiv1::\\_\\_forced\\_unwind](#)

*Thrown as part of forced unwinding.*

*A magic placeholder class that can be caught by reference to recognize forced unwinding.*

### 6.117.1 Detailed Description

The header provides an interface to the C++ ABI.

Definition in file [cxxabi-forced.h](#).

## 6.118 cxxabi.h File Reference

### Classes

- class [\\_\\_gnu\\_cxx::recursive\\_init\\_error](#)

*Exception thrown by `__cxa_guard_acquire`.*

*6.7[stmt.dcl]/4: If control re-enters the declaration (recursively) while the object is being initialized, the behavior is undefined.*

### Namespaces

- namespace [\\_\\_gnu\\_cxx](#)
- namespace [abi](#)

### Defines

- `#define _GLIBCXX_NOTHROW`

### Typedefs

- typedef `__cxa_cdtor_return_type(* __cxxabiv1::__cxa_cdtor_type)(void *)`

## Functions

- `int __cxxabiv1::__cxa_atexit (void(*)(void *), void *, void *) throw ()`
- `void __cxxabiv1::__cxa_bad_cast ()`
- `void __cxxabiv1::__cxa_bad_typeid ()`

- `void * __cxxabiv1::__cxa_vec_new3 (size_t __element_count, size_t __element_size, size_t __padding_size, __cxa_ctor_type __constructor, __cxa_ctor_type __destructor, void(* __alloc)(size_t), void(* __dealloc)(void *, size_t))`
- `void * __cxxabiv1::__dynamic_cast (const void * __src_ptr, const __class_type_info * __src_type, const __class_type_info * __dst_type, ptrdiff_t __src2dst)`

### 6.118.1 Detailed Description

The header provides an interface to the C++ ABI.

Definition in file [cxxabi.h](#).

## 6.119 cxxabi\_tweaks.h File Reference

### Defines

- `#define _GLIBCXX_CXA_VEC_CTOR_RETURN(x)`
- `#define _GLIBCXX_GUARD_BIT`
- `#define _GLIBCXX_GUARD_PENDING_BIT`
- `#define _GLIBCXX_GUARD_SET(x)`
- `#define _GLIBCXX_GUARD_TEST(x)`
- `#define _GLIBCXX_GUARD_WAITING_BIT`

### Typedefs

- `typedef void __cxxabiv1::__cxa_cdtor_return_type`
- `typedef void __cxxabiv1::__cxa_vec_ctor_return_type`

### Functions

- `__extension__ typedef int __guard __cxxabiv1::__attribute__ ((mode(__DI_ - __)))`

### 6.119.1 Detailed Description

The header provides an CPU-variable interface to the C++ ABI.

Definition in file [cxxabi\\_tweaks.h](#).

### 6.120.1 Detailed Description

This file is a GNU debug extension to the Standard C++ Library.

Definition in file [debug.h](#).

## 6.121 `debug_allocator.h` File Reference

### Classes

- class `__gnu_cxx::debug_allocator< _Alloc >`  
*A meta-allocator with debugging bits, as per [20.4].  
This is precisely the allocator defined in the C++ Standard.*
  - all allocation calls operator new
  - all deallocation calls operator delete.

## Namespaces

- namespace [\\_\\_gnu\\_cxx](#)

### 6.121.1 Detailed Description

This file is a GNU extension to the Standard C++ Library. You should only include this header if you are using GCC 3 or later.

Definition in file [debug\\_allocator.h](#).

## 6.122 debug\_map\_base.hpp File Reference

### 6.122.1 Detailed Description

Contains a debug-mode base for all maps.

Definition in file [debug\\_map\\_base.hpp](#).

## 6.123 decimal File Reference

### Classes

### 6.130.1 Detailed Description

This is an internal header file, included by other library headers. You should not attempt to use it directly.

Definition in file [error\\_constants.h](#).

## 6.131 exception File Reference

### Classes

- class [std::bad\\_exception](#)
- class [std::exception](#)

*Base class for all library exceptions.*

## Namespaces

- namespace [\\_\\_gnu\\_cxx](#)
- namespace [std](#)

## Typedefs

- typedef void(\* [std::terminate\\_handler](#) )()
- typedef void(\* [std::unexpected\\_handler](#) )()

## Functions

- void [\\_\\_gnu\\_cxx::\\_\\_verbose\\_terminate\\_handler](#) ()
- terminate\_handler [std::set\\_terminate](#) (terminate\_handler) throw ()
- unexpected\_handler [std::set\\_unexpected](#) (unexpected\_handler) throw ()
- void [std::terminate](#) () \_\_attribute\_\_((\_\_noreturn\_\_)) throw ()
- bool [std::uncaught\\_exception](#) () \_\_attribute\_\_((\_\_pure\_\_)) throw ()
- void [std::unexpected](#) () \_\_attribute\_\_((\_\_noreturn\_\_))

### 6.131.1 Detailed Description

This is a Standard C++ Library header.

Definition in file [exception](#).

## 6.132 exception.hpp File Reference

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### Functions

- void [\\_\\_gnu\\_pbds::\\_\\_throw\\_container\\_error](#) (void)
- void [\\_\\_gnu\\_pbds::\\_\\_throw\\_insert\\_error](#) (void)
- void [\\_\\_gnu\\_pbds::\\_\\_throw\\_join\\_error](#) (void)
- void [\\_\\_gnu\\_pbds::\\_\\_throw\\_resize\\_error](#) (void)

### 6.132.1 Detailed Description

Contains exception classes.

Definition in file [exception.hpp](#).

## 6.133 exception\_ptr.h File Reference

### Classes

- class [std::\\_\\_exception\\_ptr::exception\\_ptr](#)  
*An opaque pointer to an arbitrary exception.*

### Namespaces

- namespace [std](#)

### Functions

- `template<typename _Ex >  
exception_ptr std::copy\_exception (_Ex __ex) throw ()`
- `exception_ptr std::current\_exception () throw ()`
- `template<typename _Ex >  
exception_ptr std::make\_exception\_ptr (_Ex __ex) throw ()`
- `bool std::\_\_exception\_ptr::operator!= (const exception_ptr &, const  
exception_ptr &) __attribute__((__pure__)) throw ()`
- `bool std::\_\_exception\_ptr::operator== (const exception_ptr &, const  
exception_ptr &) __attribute__((__pure__)) throw ()`
- `void std::rethrow\_exception (exception_ptr) __attribute__((__noreturn__))`
- `void std::\_\_exception\_ptr::swap (exception_ptr &__lhs, exception_ptr &__-  
rhs)`

### 6.133.1 Detailed Description

This is an internal header file, included by other headers and the implementation. You should not attempt to use it directly.

Definition in file [exception\\_ptr.h](#).

## 6.134 extptr\_allocator.h File Reference

### Classes

- class [\\_\\_gnu\\_cxx::\\_ExtPtr\\_allocator< \\_Tp >](#)  
*An example allocator which uses a non-standard pointer type.  
This allocator specifies that containers use a 'relative pointer' as it's pointer type. (See [ext/pointer.h](#)) Memory allocation in this example is still performed using [std::allocator](#).*

### Namespaces

- namespace [\\_\\_gnu\\_cxx](#)

### Functions

- `template<typename _Tp >  
void \_\_gnu\_cxx::swap (_ExtPtr_allocator< _Tp > &__larg, _ExtPtr_allocator< _Tp > &__rarg)`

#### 6.134.1 Detailed Description

##### Author

Bob Walters

An example allocator which uses an alternative pointer type from bits/pointer.h. Supports test cases which confirm container support for alternative pointers.

Definition in file [extptr\\_allocator.h](#).

## 6.135 features.h File Reference

Defines on whether to include algorithm variants.

### Defines

- `#define \_GLIBCXX\_BAL\_QUICKSORT`
- `#define \_GLIBCXX\_FIND\_CONSTANT\_SIZE\_BLOCKS`
- `#define \_GLIBCXX\_FIND\_EQUAL\_SPLIT`
- `#define \_GLIBCXX\_FIND\_GROWING\_BLOCKS`

- `#define _GLIBCXX_MERGESORT`
- `#define _GLIBCXX_QUICKSORT`
- `#define _GLIBCXX_TREE_DYNAMIC_BALANCING`
- `#define _GLIBCXX_TREE_FULL_COPY`
- `#define _GLIBCXX_TREE_INITIAL_SPLITTING`

### 6.135.1 Detailed Description

Defines on whether to include algorithm variants. Less variants reduce executable size and compile time. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file [features.h](#).

### 6.135.2 Define Documentation

#### 6.135.2.1 `#define _GLIBCXX_BAL_QUICKSORT`

Include parallel dynamically load-balanced quicksort.

**See also**

`__gnu_parallel::_Settings::sort_algorithm`

Definition at line 55 of file [features.h](#).

#### 6.135.2.2 `#define _GLIBCXX_FIND_CONSTANT_SIZE_BLOCKS`

Include the equal-sized blocks variant for `std::find`.

**See also**

`__gnu_parallel::_Settings::find_algorithm`

Definition at line 67 of file [features.h](#).

#### 6.135.2.3 `#define _GLIBCXX_FIND_EQUAL_SPLIT`

Include the equal splitting variant for `std::find`.

**See also**

`__gnu_parallel::_Settings::find_algorithm`

Definition at line 74 of file [features.h](#).

**6.135.2.4 #define \_GLIBCXX\_FIND\_GROWING\_BLOCKS**

Include the growing blocks variant for `std::find`.

**See also**

`__gnu_parallel::_Settings::find_algorithm`

Definition at line 61 of file `features.h`.

**6.135.2.5 #define \_GLIBCXX\_MERGESORT**

Include parallel multi-way mergesort.

**See also**

`__gnu_parallel::_Settings::sort_algorithm`

Definition at line 41 of file `features.h`.

**6.135.2.6 #define \_GLIBCXX\_QUICKSORT**

Include parallel unbalanced quicksort.

**See also**

`__gnu_parallel::_Settings::sort_algorithm`

Definition at line 48 of file `features.h`.

**6.135.2.7 #define \_GLIBCXX\_TREE\_DYNAMIC\_BALANCING**

Include the dynamic balancing variant for `_Rb_tree::insert_unique(_Iter beg, _Iter __end)`.

**See also**

`__gnu_parallel::_Rb_tree`

Definition at line 91 of file `features.h`.

#### 6.135.2.8 `#define _GLIBCXX_TREE_FULL_COPY`

In order to sort the input sequence of `_Rb_tree::insert_unique(_Iter beg, _Iter __end)` a full copy of the input elements is done.

##### See also

`__gnu_parallel::_Rb_tree`

Definition at line 100 of file `features.h`.

#### 6.135.2.9 `#define _GLIBCXX_TREE_INITIAL_SPLITTING`

Include the initial splitting variant for `_Rb_tree::insert_unique(_Iter beg, _Iter __end)`.

##### See also

`__gnu_parallel::_Rb_tree`

Definition at line 83 of file `features.h`.

## 6.136 `fnv.h` File Reference

### 6.136.1 Detailed Description

This is a Standard C++ Library header.

Definition in file [fnv.h](#).

## 6.137 `find.h` File Reference

Parallel implementation base for `std::find()`, `std::equal()` and related functions. This file is a GNU parallel extension to the Standard C++ Library.

### Namespaces

- namespace [\\_\\_gnu\\_parallel](#)

## Functions

- `template<typename _RAIter1, typename _RAIter2, typename _Pred, typename _Selector >`  
`std::pair< _RAIter1, _RAIter2 > __gnu_parallel::__find_template (_RAIter1`  
`__begin1, _RAIter1 __end1, _RAIter2 __begin2, _Pred __pred, _Selector __-`  
`selector)`
- `template<typename _RAIter1, typename _RAIter2, typename _Pred, typename _Selector >`  
`std::pair< _RAIter1, _RAIter2 > __gnu_parallel::__find_template (_RAIter1`  
`__begin1, _RAIter1 __end1, _RAIter2 __begin2, _Pred __pred, _Selector __-`  
`selector, constant_size_blocks_tag)`
- `template<typename _RAIter1, typename _RAIter2, typename _Pred, typename _Selector >`  
`std::pair< _RAIter1, _RAIter2 > __gnu_parallel::__find_template (_RAIter1`  
`__begin1, _RAIter1 __end1, _RAIter2 __begin2, _Pred __pred, _Selector __-`  
`selector, growing_blocks_tag)`
- `template<typename _RAIter1, typename _RAIter2, typename _Pred, typename _Selector >`  
`std::pair< _RAIter1, _RAIter2 > __gnu_parallel::__find_template (_RAIter1`  
`__begin1, _RAIter1 __end1, _RAIter2 __begin2, _Pred __pred, _Selector __-`  
`selector, equal_split_tag)`

### 6.137.1 Detailed Description

Parallel implementation base for `std::find()`, `std::equal()` and related functions. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file [find.h](#).

## 6.138 find\_selectors.h File Reference

`_Function` objects representing different tasks to be plugged into the parallel find algorithm. This file is a GNU parallel extension to the Standard C++ Library.

## Classes

- struct [\\_\\_gnu\\_parallel::\\_\\_adjacent\\_find\\_selector](#)  
*Test predicate on two adjacent elements.*
- struct [\\_\\_gnu\\_parallel::\\_\\_find\\_first\\_of\\_selector< \\_FIterator >](#)  
*Test predicate on several elements.*
- struct [\\_\\_gnu\\_parallel::\\_\\_find\\_if\\_selector](#)  
*Test predicate on a single element, used for `std::find()` and `std::find_if()`.*

- struct [\\_\\_gnu\\_parallel::\\_\\_generic\\_find\\_selector](#)  
*Base class of all [\\_\\_gnu\\_parallel::\\_\\_find\\_template](#) selectors.*
- struct [\\_\\_gnu\\_parallel::\\_\\_mismatch\\_selector](#)  
*Test inverted predicate on a single element.*

## Namespaces

- namespace [\\_\\_gnu\\_parallel](#)

### 6.138.1 Detailed Description

[\\_Function](#) objects representing different tasks to be plugged into the parallel find algorithm. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file [find\\_selectors.h](#).

## 6.139 [for\\_each.h](#) File Reference

Main interface for embarrassingly parallel functions.

## Namespaces

- namespace [\\_\\_gnu\\_parallel](#)

## Functions

- template<typename [\\_Iter](#) , typename [\\_UserOp](#) , typename [\\_Functionality](#) , typename [\\_Red](#) , typename [\\_Result](#) >  
[\\_UserOp](#) [\\_\\_gnu\\_parallel::\\_\\_for\\_each\\_template\\_random\\_access](#) ([\\_Iter](#) \_\_begin, [\\_Iter](#) \_\_end, [\\_UserOp](#) \_\_user\_op, [\\_Functionality](#) &\_\_functionality, [\\_Red](#) \_\_reduction, [\\_Result](#) \_\_reduction\_start, [\\_Result](#) &\_\_output, typename [std::iterator\\_traits< \\_Iter >::difference\\_type](#) \_\_bound, [\\_Parallelism](#) \_\_parallelism\_tag)

### 6.139.1 Detailed Description

Main interface for embarrassingly parallel functions. The explicit implementation are in other header files, like [workstealing.h](#), [par\\_loop.h](#), [omp\\_loop.h](#), and [omp\\_loop\\_static.h](#). This file is a GNU parallel extension to the Standard C++ Library.

Definition in file [for\\_each.h](#).

## 6.140 for\_each\_selectors.h File Reference

Functors representing different tasks to be plugged into the generic parallelization methods for embarrassingly parallel functions. This file is a GNU parallel extension to the Standard C++ Library.

### Classes

- struct [\\_\\_gnu\\_parallel::\\_\\_accumulate\\_binop\\_reduct< \\_BinOp >](#)  
*General reduction, using a binary operator.*
- struct [\\_\\_gnu\\_parallel::\\_\\_accumulate\\_selector< \\_It >](#)  
*std::accumulate() selector.*
- struct [\\_\\_gnu\\_parallel::\\_\\_adjacent\\_difference\\_selector< \\_It >](#)  
*Selector that returns the difference between two adjacent \_\_elements.*
- struct [\\_\\_gnu\\_parallel::\\_\\_count\\_if\\_selector< \\_It, \\_Diff >](#)  
*std::count\_if() selector.*
- struct [\\_\\_gnu\\_parallel::\\_\\_count\\_selector< \\_It, \\_Diff >](#)  
*std::count() selector.*
- struct [\\_\\_gnu\\_parallel::\\_\\_fill\\_selector< \\_It >](#)  
*std::fill() selector.*
- struct [\\_\\_gnu\\_parallel::\\_\\_for\\_each\\_selector< \\_It >](#)  
*std::for\_each() selector.*
- struct [\\_\\_gnu\\_parallel::\\_\\_generate\\_selector< \\_It >](#)  
*std::generate() selector.*
- struct [\\_\\_gnu\\_parallel::\\_\\_generic\\_for\\_each\\_selector< \\_It >](#)  
*Generic \_\_selector for embarrassingly parallel functions.*
- struct [\\_\\_gnu\\_parallel::\\_\\_identity\\_selector< \\_It >](#)  
*Selector that just returns the passed iterator.*
- struct [\\_\\_gnu\\_parallel::\\_\\_inner\\_product\\_selector< \\_It, \\_It2, \\_Tp >](#)

[`std::inner\_product\(\)`](#) selector.

- struct [`\_\_gnu\_parallel::\_\_max\_element\_reduct<\_Compare, \_It>`](#)

*Reduction for finding the maximum element, using a comparator.*

- struct [`\_\_gnu\_parallel::\_\_min\_element\_reduct<\_Compare, \_It>`](#)

*Reduction for finding the maximum element, using a comparator.*

- struct [`\_\_gnu\_parallel::\_\_replace\_if\_selector<\_It, \_Op, \_Tp>`](#)

*`std::replace()` selector.*

- struct [`\_\_gnu\_parallel::\_\_replace\_selector<\_It, \_Tp>`](#)

*`std::replace()` selector.*

- struct [`\_\_gnu\_parallel::\_\_transform1\_selector<\_It>`](#)

*`std::transform()` \_\_selector, one input sequence variant.*

- struct [`\_\_gnu\_parallel::\_\_transform2\_selector<\_It>`](#)

*`std::transform()` \_\_selector, two input sequences variant.*

- struct [`\_\_gnu\_parallel::\_\_DummyReduct`](#)

*Reduction function doing nothing.*

- struct [`\_\_gnu\_parallel::\_\_Nothing`](#)

*Functor doing nothing.*

## Namespaces

- namespace [`\_\_gnu\_parallel`](#)

### 6.140.1 Detailed Description

Functors representing different tasks to be plugged into the generic parallelization methods for embarrassingly parallel functions. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file [for\\_each\\_selectors.h](#).

## 6.141 formatter.h File Reference

### 6.142.1 Detailed Description

This is a Standard C++ Library header.

Definition in file [forward\\_list.h](#).

## 6.143 forward\_list.tcc File Reference

### Namespaces

- namespace [std](#)

### Functions

- template<typename \_Tp, typename \_Alloc >  
bool [std::operator==](#) (const forward\_list< \_Tp, \_Alloc > &\_\_lx, const forward\_list< \_Tp, \_Alloc > &\_\_ly)

### 6.143.1 Detailed Description

This is a Standard C++ Library header.

Definition in file [forward\\_list.tcc](#).

## 6.144 fstream File Reference

### Classes

- class [std::basic\\_filebuf<\\_CharT, \\_Traits>](#)  
*The actual work of input and output (for files).  
This class associates both its input and output sequence with an external disk file, and maintains a joint file position for both sequences. Many of its semantics are described in terms of similar behavior in the Standard C Library's FILE streams.*
- class [std::basic\\_fstream<\\_CharT, \\_Traits>](#)  
*Controlling input and output for files.  
This class supports reading from and writing to named files, using the inherited functions from [std::basic\\_istream](#). To control the associated sequence, an instance of [std::basic\\_filebuf](#) is used, which this page refers to as *sb*.*
- class [std::basic\\_ifstream<\\_CharT, \\_Traits>](#)  
*Controlling input for files.  
This class supports reading from named files, using the inherited functions from [std::basic\\_istream](#). To control the associated sequence, an instance of [std::basic\\_filebuf](#) is used, which this page refers to as *sb*.*
- class [std::basic\\_ofstream<\\_CharT, \\_Traits>](#)  
*Controlling output for files.  
This class supports reading from named files, using the inherited functions from [std::basic\\_ostream](#). To control the associated sequence, an instance of [std::basic\\_filebuf](#) is used, which this page refers to as *sb*.*

- class `std::bad_function_call`

Exception class thrown when class template function's operator() is called with an empty target.

- class [std::function< \\_Res\(\\_ArgTypes...\)>](#)  
Primary class template for `std::function`.  
Polymorphic function wrapper.
- struct [std::is\\_bind\\_expression< \\_Tp >](#)  
Determines if the given type `_Tp` is a function object should be treated as a subexpression when evaluating calls to function objects returned by [bind\(\)](#). [TR1 3.6.1].
- struct [std::is\\_bind\\_expression< \\_Bind< \\_Signature > >](#)  
Class template `_Bind` is always a bind expression.
- struct [std::is\\_bind\\_expression< \\_Bind\\_result< \\_Result, \\_Signature > >](#)  
Class template `_Bind` is always a bind expression.
- struct [std::is\\_placeholder< \\_Tp >](#)  
Determines if the given type `_Tp` is a placeholder in a [bind\(\)](#) expression and, if so, which placeholder it is. [TR1 3.6.2].
- struct [std::is\\_placeholder< \\_Placeholder< \\_Num > >](#)
- class [std::reference\\_wrapper< \\_Tp >](#)  
Primary class template for `reference_wrapper`.

### 6.166.1 Detailed Description

This is a Standard C++ Library header.

Definition in file [iosfwd](#).

## 6.167 iostream File Reference

### Namespaces

- namespace [std](#)

### Variables

- static `ios_base::Init` **std::\_\_ioinit**

### Standard Stream Objects

The `<iostream>` header declares the eight standard stream objects. For other declarations, see <http://gcc.gnu.org/onlinedocs/libstdc++/manual/bk01pt11ch24.html> and the *I/O forward declarations*

*They are required by default to cooperate with the global C library's FILE streams, and to be available during program startup and termination. For more information, see the HOWTO linked to above.*

- `istream` [std::cin](#)
- `ostream` [std::cout](#)
- `ostream` [std::cerr](#)
- `ostream` [std::clog](#)
- `wistream` [std::wcin](#)
- `wostream` [std::wcout](#)
- `wostream` [std::wcerr](#)
- `wostream` [std::wclog](#)

### 6.167.1 Detailed Description

This is a Standard C++ Library header.

Definition in file [iostream](#).

## 6.168 istream File Reference

### Classes

- class `std::basic_iostream< _CharT, _Traits >`  
*Merging istream and ostream capabilities.*  
*This class multiply inherits from the input and output stream classes simply to provide a single interface.*
- class `std::basic_istream< _CharT, _Traits >`  
*Controlling input.*  
*This is the base class for all input streams. It provides text formatting of all builtin types, and communicates with any class derived from `basic_streambuf` to do the actual input.*
- class `std::basic_istream< _CharT, _Traits >::sentry`  
*Performs setup work for input streams.*

### Namespaces

- `#define PB_DS_CLASS_T_DEC`
- `#define PB_DS_CLASS_T_DEC`

#### 6.180.1 Detailed Description

Contains policies for list update containers.

Definition in file [list\\_update\\_policy.hpp](#).

## 6.181 `locale` File Reference

#### 6.181.1 Detailed Description

This is a Standard C++ Library header.

Definition in file [locale](#).

## 6.182 `locale_classes.h` File Reference

### Classes

- class [std::collate<\\_CharT>](#)  
*Facet for localized string comparison.*
- class [std::collate\\_byname<\\_CharT>](#)  
*class [collate\\_byname](#) [22.2.4.2].*
- class [std::locale](#)

Container class for localization functionality.

The locale class is first a class wrapper for C library locales. It is also an extensible container for user-defined localization. A locale is a collection of facets that implement various localization features such as money, time, and number printing.

- class [std::locale::facet](#)

Localization functionality base class.

The facet class is the base class for a localization feature, such as money, time, and number printing. It provides common support for facets and reference management.

- class [std::locale::id](#)

Facet ID class.

The ID class provides facets with an index used to identify them. Every facet class must define a public static member [locale::id](#), or be derived from a facet that provides this member; otherwise the facet cannot be used in a locale. The [locale::id](#) ensures that each class type gets a unique identifier.

## Namespaces

- namespace [std](#)

## Functions

- `template<typename _Facet >  
bool std::has\_facet (const locale &__loc) throw ()`
- `template<typename _Facet >  
const _Facet & std::use\_facet (const locale &__loc)`

### 6.182.1 Detailed Description

This is an internal header file, included by other library headers. You should not attempt to use it directly.

### Classes

- class [std::\\_\\_ctype\\_abstract\\_base< \\_CharT >](#)  
*Common base for ctype facet.*
- class [std::ctype< \\_CharT >](#)  
*Primary class template ctype facet.*  
*This template class defines classification and conversion functions for character sets. It wraps ctype functionality. Ctype gets used by streams for many I/O operations.*
- class [std::ctype< char >](#)  
*The [ctype<char>](#) specialization.*  
*This class defines classification and conversion functions for the char type. It gets used by char streams for many I/O operations. The char specialization provides a number of optimizations as well.*
- class [std::ctype< wchar\\_t >](#)  
*The [ctype<wchar\\_t>](#) specialization.*  
*This class defines classification and conversion functions for the wchar\_t type. It gets used by wchar\_t streams for many I/O operations. The wchar\_t specialization provides a number of optimizations as well.*
- class [std::ctype\\_byname< \\_CharT >](#)  
*class [ctype\\_byname](#) [22.2.1.2].*
- class [std::ctype\\_byname< char >](#)  
*22.2.1.4 Class [ctype\\_byname](#) specializations.*

- class `std::num_get<_CharT, _InIter >`  
*Primary class template `num_get`.  
This facet encapsulates the code to parse and return a number from a string. It is used by the istream numeric extraction operators.*
- class `std::num_put<_CharT, _OutIter >`  
*Primary class template `num_put`.  
This facet encapsulates the code to convert a number to a string. It is used by the ostream numeric insertion operators.*
- class `std::numpunct<_CharT >`  
*Primary class template `numpunct`.  
This facet stores several pieces of information related to printing and scanning numbers, such as the decimal point character. It takes a template parameter specifying the char type. The numpunct facet is used by streams for many I/O operations involving numbers.*
- class `std::numpunct_byname<_CharT >`  
*class `numpunct_byname` [22.2.3.2].*

## 6.186 locale\_facets\_nonio.h File Reference

### Classes

- class [std::messages<\\_CharT>](#)  
*Primary class template messages.  
This facet encapsulates the code to retrieve messages from message catalogs. The only thing defined by the standard for this facet is the interface. All underlying functionality is implementation-defined.*
- struct [std::messages\\_base](#)  
*Messages facet base class providing catalog typedef.*
- class [std::messages\\_byname<\\_CharT>](#)  
*class messages\_byname [22.2.7.2].*
- class [std::money\\_base](#)

*Money format ordering data.*

*This class contains an ordered array of 4 fields to represent the pattern for formatting a money amount. Each field may contain one entry from the part enum. symbol, sign, and value must be present and the remaining field must contain either none or space.*

- class `std::money_get< _CharT, _InIter >`

*Primary class template `money_get`.*

*This facet encapsulates the code to parse and return a monetary amount from a string.*

- class `std::money_put< _CharT, _OutIter >`

*Primary class template `money_put`.*

*This facet encapsulates the code to format and output a monetary amount.*

- class `std::moneypunct< _CharT, _Intl >`

*Primary class template `moneypunct`.*

*This facet encapsulates the punctuation, grouping and other formatting features of money amount string representations.*

- class `std::moneypunct_byname< _CharT, _Intl >`

*class `moneypunct_byname` [22.2.6.4].*

- class `std::time_base`

*Time format ordering data.*

*This class provides an enum representing different orderings of time: day, month, and year.*

- class `std::time_get< _CharT, _InIter >`

*Primary class template `time_get`.*

*This facet encapsulates the code to parse and return a date or time from a string. It is used by the istream numeric extraction operators.*

- class `std::time_get_byname< _CharT, _InIter >`

*class `time_get_byname` [22.2.5.2].*

- class `std::time_put< _CharT, _OutIter >`

*Primary class template `time_put`.*

*This facet encapsulates the code to format and output dates and times according to formats used by `strftime()`.*

- class `std::time_put_byname< _CharT, _OutIter >`

*class `time_put_byname` [22.2.5.4].*

### 6.190.1 Detailed Description

This file is a GNU debug extension to the Standard C++ Library.

Definition in file [macros.h](#).

## 6.190.2 Define Documentation

### 6.190.2.1 `#define __glibcxx_check_erase( _Position )`

Verify that we can erase the element referenced by the iterator *\_Position*. We can erase the element if the *\_Position* iterator is dereferenceable and references this sequence.

Definition at line 126 of file macros.h.

### 6.190.2.2 `#define __glibcxx_check_erase_after( _Position )`

Verify that we can erase the element after the iterator *\_Position*. We can erase the element if the *\_Position* iterator is before a dereferenceable one and references this sequence.

Definition at line 140 of file macros.h.

### 6.190.2.3 `#define __glibcxx_check_erase_range( _First, _Last )`

Verify that we can erase the elements in the iterator range [*\_First*, *\_Last*). We can erase the elements if [*\_First*, *\_Last*) is a valid iterator range within this sequence.

Definition at line 154 of file macros.h.

### 6.190.2.4 `#define __glibcxx_check_erase_range_after( _First, _Last )`

Verify that we can erase the elements in the iterator range (*\_First*, *\_Last*). We can erase the elements if (*\_First*, *\_Last*) is a valid iterator range within this sequence.

Definition at line 166 of file macros.h.

### 6.190.2.5 `#define __glibcxx_check_heap_pred( _First, _Last, _Pred )`

Verify that the iterator range [*\_First*, *\_Last*) is a heap w.r.t. the predicate *\_Pred*.

Definition at line 297 of file macros.h.

### 6.190.2.6 `#define __glibcxx_check_insert( _Position )`

Verify that we can insert into *\*this* with the iterator *\_Position*. Insertion into a container at a specific position requires that the iterator be nonsingular, either dereferenceable or past-the-end, and that it reference the sequence we are inserting into. Note that this macro is only valid when the container is a *\_Safe\_sequence* and the iterator is a *\_Safe\_iterator*.

Definition at line 64 of file macros.h.

#### 6.190.2.7 **#define \_\_glibcxx\_check\_insert\_after( *\_Position* )**

Verify that we can insert into \*this after the iterator *\_Position*. Insertion into a container after a specific position requires that the iterator be nonsingular, either dereferenceable or before-begin, and that it reference the sequence we are inserting into. Note that this macro is only valid when the container is a *\_Safe\_sequence* and the iterator is a *\_Safe\_iterator*.

Definition at line 81 of file macros.h.

#### 6.190.2.8 **#define \_\_glibcxx\_check\_insert\_range( *\_Position*, *\_First*, *\_Last* )**

Verify that we can insert the values in the iterator range [*\_First*, *\_Last*) into \*this with the iterator *\_Position*. Insertion into a container at a specific position requires that the iterator be nonsingular (i.e., either dereferenceable or past-the-end), that it reference the sequence we are inserting into, and that the iterator range [*\_First*, *\_Last*) is a valid (possibly empty) range. Note that this macro is only valid when the container is a *\_Safe\_sequence* and the iterator is a *\_Safe\_iterator*.

#### **Todo**

We would like to be able to check for noninterference of *\_Position* and the range [*\_First*, *\_Last*), but that can't (in general) be done.

Definition at line 101 of file macros.h.

#### 6.190.2.9 **#define \_\_glibcxx\_check\_insert\_range\_after( *\_Position*, *\_First*, *\_Last* )**

Verify that we can insert the values in the iterator range [*\_First*, *\_Last*) into \*this after the iterator *\_Position*. Insertion into a container after a specific position requires that the iterator be nonsingular (i.e., either dereferenceable or past-the-end), that it reference the sequence we are inserting into, and that the iterator range [*\_First*, *\_Last*) is a valid (possibly empty) range. Note that this macro is only valid when the container is a *\_Safe\_sequence* and the iterator is a *\_Safe\_iterator*.

#### **Todo**

We would like to be able to check for noninterference of *\_Position* and the range [*\_First*, *\_Last*), but that can't (in general) be done.

Definition at line 118 of file macros.h.

**6.190.2.10** `#define __glibcxx_check_partitioned_lower( _First, _Last, _Value )`

Verify that the iterator range [*\_First*, *\_Last*) is partitioned w.r.t. the value *\_Value*.

Definition at line 245 of file macros.h.

**6.190.2.11** `#define __glibcxx_check_partitioned_lower_pred( _First, _Last, _Value, _Pred )`

Verify that the iterator range [*\_First*, *\_Last*) is partitioned w.r.t. the value *\_Value* and predicate *\_Pred*.

Definition at line 265 of file macros.h.

**6.190.2.12** `#define __glibcxx_check_partitioned_upper_pred( _First, _Last, _Value, _Pred )`

Verify that the iterator range [*\_First*, *\_Last*) is partitioned w.r.t. the value *\_Value* and predicate *\_Pred*.

Definition at line 277 of file macros.h.

**6.190.2.13** `#define __glibcxx_check_sorted_pred( _First, _Last, _Pred )`

Verify that the iterator range [*\_First*, *\_Last*) is sorted by the predicate *\_Pred*.

Definition at line 216 of file macros.h.

**6.190.2.14** `#define _GLIBCXX_DEBUG_VERIFY( _Condition, _ErrorMessage )`

Macros used by the implementation to verify certain properties. These macros may only be used directly by the debug wrappers. Note that these are macros (instead of the more obviously *correct* choice of making them functions) because we need line and file information at the call site, to minimize the distance between the user error and where the error is reported.

Definition at line 42 of file macros.h.

### 6.209.1 Detailed Description

Implementation of sequential and parallel multiway merge. Explanations on the high-speed merging routines in the appendix of

P. Sanders. Fast priority queues for cached memory. ACM Journal of Experimental Algorithmics, 5, 2000.

This file is a GNU parallel extension to the Standard C++ Library.

Definition in file [multiway\\_merge.h](#).

## 6.209.2 Define Documentation

### 6.209.2.1 #define \_GLIBCXX\_PARALLEL\_LENGTH( \_\_s )

Length of a sequence described by a pair of iterators.

Definition at line 53 of file multiway\_merge.h.

Referenced by `__gnu_parallel::__sequential_multiway_merge()`, `__gnu_parallel::multiway_merge_exact_splitting()`, `__gnu_parallel::multiway_merge_loser_tree()`, `__gnu_parallel::multiway_merge_sampling_splitting()`, and `__gnu_parallel::parallel_multiway_merge()`.

## 6.210 multiway\_mergesort.h File Reference

Parallel multiway merge sort. This file is a GNU parallel extension to the Standard C++ Library.

## Variables

- const nothrow\_t [std::nothrow](#)

### 6.213.1 Detailed Description

This is a Standard C++ Library header.

The header `new` defines several functions to manage dynamic memory and handling memory allocation errors; see [http://gcc.gnu.org/onlinedocs/libstdc++/18\\_support/howto.html#4](http://gcc.gnu.org/onlinedocs/libstdc++/18_support/howto.html#4) for more.

Definition in file [new](#).

## 6.213.2 Function Documentation

### 6.213.2.1 `void operator delete ( void * ) throw ()`

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

### 6.213.2.2 `void operator delete ( void *, const std::nothrow_t & ) throw ()`

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

### 6.213.2.3 `void operator delete ( void *, void * ) throw () [inline]`

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

Definition at line 107 of file new.

#### 6.213.2.4 void operator delete[] ( void \* ) throw ()

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

#### 6.213.2.5 void operator delete[] ( void \*, const std::nothrow\_t & ) throw ()

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

#### 6.213.2.6 void operator delete[] ( void \*, void \* ) throw () [inline]

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)

- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

Definition at line 108 of file new.

#### 6.213.2.7 `void* operator new ( std::size_t, void * __p ) throw () [inline]`

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

Definition at line 103 of file new.

#### 6.213.2.8 `void* operator new ( std::size_t, const std::nothrow_t & ) throw ()`

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

#### 6.213.2.9 `void* operator new ( std::size_t ) throw (std::bad_alloc)`

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)

- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

#### 6.213.2.10 `void* operator new[] ( std::size_t, const std::nothrow_t & ) throw ()`

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

#### 6.213.2.11 `void* operator new[] ( std::size_t ) throw (std::bad_alloc)`

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

### 6.213.2.12 void\* operator new[] ( std::size\_t, void \* \_\_p ) throw () [inline]

These are replaceable signatures:

- normal single new and delete (no arguments, throw `bad_alloc` on error)
- normal array new and delete (same)
- `nothrow` single new and delete (take a `nothrow` argument, return `NULL` on error)
- `nothrow` array new and delete (same)

Placement new and delete signatures (take a memory address argument, does nothing) may not be replaced by a user's program.

Definition at line 104 of file `new`.

## 6.214 new\_allocator.h File Reference

### Classes

- class `__gnu_cxx::new_allocator<_Tp>`  
*An allocator that uses global new, as per [20.4].  
This is precisely the allocator defined in the C++ Standard.*
  - all allocation calls `operator new`
  - all deallocation calls `operator delete`.

### Namespaces

- namespace `__gnu_cxx`

### Functions

- `template<typename _Tp>`  
`bool __gnu_cxx::operator!= (const new_allocator<_Tp> &, const new_allocator<_Tp> &)`
- `template<typename _Tp>`  
`bool __gnu_cxx::operator== (const new_allocator<_Tp> &, const new_allocator<_Tp> &)`

### 6.214.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Definition in file [new\\_allocator.h](#).

void std::__ostream_fill (basic_ostream< _CharT, _Traits > &__out, stream-  
size __n)`
- `template wostream & std::__ostream_insert (wostream &, const wchar_t *,  
streamsize)`
- `template ostream & std::__ostream_insert (ostream &, const char *, stream-  
size)`
- `template<typename _CharT, typename _Traits >  
basic_ostream< _CharT, _Traits > & std::__ostream_insert (basic_ostream<  
_CharT, _Traits > &__out, const _CharT *__s, streamsize __n)`
- `template<typename _CharT, typename _Traits >  
void std::__ostream_write (basic_ostream< _CharT, _Traits > &__out, const  
_CharT *__s, streamsize __n)`

### 6.225.1 Detailed Description

This is an internal header file, included by other library headers. You should not attempt to use it directly.

Definition in file [ostream\\_insert.h](#).

## 6.226 par\_loop.h File Reference

Parallelization of embarrassingly parallel execution by means of equal splitting. This file is a GNU parallel extension to the Standard C++ Library.

## Namespaces

- namespace [\\_\\_gnu\\_parallel](#)

## Functions

- `template<typename _RAIter, typename _Op, typename _Fu, typename _Red, typename _Result>  
>  
_Op \_\_gnu\_parallel::\_\_for\_each\_template\_random\_access\_ed (_RAIter __-  
begin, _RAIter __end, _Op __o, _Fu &__f, _Red __r, _Result __base, _-  
Result &__output, typename std::iterator_traits<_RAIter>::difference_type __-  
bound)`

### 6.226.1 Detailed Description

Parallelization of embarrassingly parallel execution by means of equal splitting. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file [par\\_loop.h](#).

## 6.227 [parallel.h](#) File Reference

End-user include file. Provides advanced settings and tuning options. This file is a GNU parallel extension to the Standard C++ Library.

### 6.227.1 Detailed Description

End-user include file. Provides advanced settings and tuning options. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file [parallel.h](#).

## 6.228 [partial\\_sum.h](#) File Reference

Parallel implementation of [std::partial\\_sum\(\)](#), i.e. prefix sums. This file is a GNU parallel extension to the Standard C++ Library.

## Namespaces

- namespace [\\_\\_gnu\\_parallel](#)

## Functions

- `template<typename _Iter, typename _OutputIterator, typename _BinaryOperation >  
_OutputIterator \_\_gnu\_parallel::\_\_parallel\_partial\_sum (_Iter __begin, _Iter  
__end, _OutputIterator __result, _BinaryOperation __bin_op)`
- `template<typename _Iter, typename _OutputIterator, typename _BinaryOperation >

diagnostics for vector to list.

Definition in file [profiler\\_vector\\_to\\_list.h](#).

## 6.247 queue File Reference

### 6.247.1 Detailed Description

This is a Standard C++ Library header.

Definition in file [queue](#).

## 6.248 queue.h File Reference

Lock-free double-ended queue. This file is a GNU parallel extension to the Standard C++ Library.

### Classes

- class [\\_\\_gnu\\_parallel::\\_RestrictedBoundedConcurrentQueue<\\_Tp>](#)

*Double-ended queue of bounded size, allowing lock-free atomic access. [push\\_front\(\)](#) and [pop\\_front\(\)](#) must not be called concurrently to each other, while [pop\\_back\(\)](#) can be called concurrently at all times. [empty\(\)](#), [size\(\)](#), and [top\(\)](#) are intentionally not provided. Calling them would not make sense in a concurrent setting.*

### Namespaces

- namespace [\\_\\_gnu\\_parallel](#)

### Defines

- [#define \\_GLIBCXX\\_VOLATILE](#)

#### 6.248.1 Detailed Description

Lock-free double-ended queue. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file [queue.h](#).

#### 6.248.2 Define Documentation

##### 6.248.2.1 #define \_GLIBCXX\_VOLATILE

Decide whether to declare certain variable volatile in this file.

Definition at line 40 of file [queue.h](#).

## 6.249 quicksort.h File Reference

Implementation of a unbalanced parallel quicksort (in-place). This file is a GNU parallel extension to the Standard C++ Library.

### Namespaces

- namespace [\\_\\_gnu\\_parallel](#)

### Functions

6.252.1 Detailed Description

This is an internal header file, included by other library headers. You should not attempt to use it directly.

Definition in file [random.tcc](#).

6.253 random_number.h File Reference

Random number generator based on the Mersenne twister. This file is a GNU parallel extension to the Standard C++ Library.

Classes

- class [__gnu_parallel::RandomNumber](#)
Random number generator, based on the Mersenne twister.

Namespaces

- namespace [__gnu_parallel](#)

6.253.1 Detailed Description

Random number generator based on the Mersenne twister. This file is a GNU parallel extension to the Standard C++ Library.

Definition in file [random_number.h](#).

6.254 random_shuffle.h File Reference

Parallel implementation of `std::random_shuffle()`. This file is a GNU parallel extension to the Standard C++ Library.

Classes

- struct [__gnu_parallel::__DRandomShufflingGlobalData<_RAIter>](#)
Data known to every thread participating in [__gnu_parallel::__parallel_random_shuffle\(\)](#).
- struct [__gnu_parallel::__DRSSorterPU<_RAIter, _RandomNumberGenerator>](#)
Local data for a thread participating in [__gnu_parallel::__parallel_random_shuffle\(\)](#).

Namespaces

- namespace [__gnu_parallel](#)

Classes

- class [__gnu_cxx::__rc_string_base<_CharT, _Traits, _Alloc>](#)

Namespaces

- namespace [__gnu_cxx](#)

6.258.1 Detailed Description

This file is a GNU extension to the Standard C++ Library. This is an internal header file, included by other library headers. You should not attempt to use it directly.

Definition in file [rc_string_base.h](#).

6.259 regex File Reference

6.259.1 Detailed Description

This is a Standard C++ Library header.

Definition in file [regex](#).

6.260 regex.h File Reference

Classes

- class [std::basic_regex<_Ch_type, _Rx_traits>](#)
- class [std::match_results<_Bi_iter, _Allocator>](#)

The results of a match or search operation.

- class `std::regex_iterator< _Bi_iter, _Ch_type, _Rx_traits >`
- class `std::regex_token_iterator< _Bi_iter, _Ch_type, _Rx_traits >`
- struct `std::regex_traits< _Ch_type >`

Describes aspects of a regular expression.

- class `std::sub_match< _BiIter >`

Namespaces

- namespace `std`

- static const syntax_option_type [std::regex_constants::ECMAScript](#)
- static const syntax_option_type [std::regex_constants::basic](#)
- static const syntax_option_type [std::regex_constants::extended](#)
- static const syntax_option_type [std::regex_constants::awk](#)
- static const syntax_option_type [std::regex_constants::grep](#)
- static const syntax_option_type [std::regex_constants::egrep](#)

5.2 Matching Rules

Matching a regular expression against a sequence of characters [first, last) proceeds according to the rules of the grammar specified for the regular expression object, modified according to the effects listed below for any bitmask elements set.

- enum [std::regex_constants::__match_flag](#) {
[_S_not_bol](#), [_S_not_eol](#), [_S_not_bow](#), [_S_not_eow](#),
[_S_any](#), [_S_not_null](#), [_S_continuous](#), [_S_prev_avail](#),
[_S_sed](#), [_S_no_copy](#), [_S_first_only](#), [_S_match_flag_last](#) }
- typedef [std::bitset](#)< [_S_match_flag_last](#) > [std::regex_constants::match_flag_type](#)
- static const match_flag_type [std::regex_constants::match_default](#)
- static const match_flag_type [std::regex_constants::match_not_bol](#)
- static const match_flag_type [std::regex_constants::match_not_eol](#)
- static const match_flag_type [std::regex_constants::match_not_bow](#)
- static const match_flag_type [std::regex_constants::match_not_eow](#)
- static const match_flag_type [std::regex_constants::match_any](#)
- static const match_flag_type [std::regex_constants::match_not_null](#)
- static const match_flag_type [std::regex_constants::match_continuous](#)
- static const match_flag_type [std::regex_constants::match_prev_avail](#)
- static const match_flag_type [std::regex_constants::format_default](#)
- static const match_flag_type [std::regex_constants::format_sed](#)
- static const match_flag_type [std::regex_constants::format_no_copy](#)
- static const match_flag_type [std::regex_constants::format_first_only](#)

6.262.1 Detailed Description

Constant definitions for the std regex library. This is an internal header file, included by other library headers. You should not attempt to use it directly.

Definition in file [regex_constants.h](#).

6.263 `regex_cursor.h` File Reference

Namespaces

- namespace [std](#)

Functions

- `template<typename _FwdIterT > _SpecializedCursor< _FwdIterT > std::__regex::__cursor (const _FwdIterT &__b, const _FwdIterT __e)`

6.263.1 Detailed Description

This is an internal header file, included by other library headers. You should not attempt to use it directly.

Definition in file [regex_cursor.h](#).

6.264 `regex_error.h` File Reference

Error and exception objects for the std regex library.

Classes

- class [std::regex_error](#)
A regular expression exception class.
The regular expression library throws objects of this class on error.

Namespaces

- namespace [std](#)
- namespace [std::regex_constants](#)

Functions

- `void std::__throw_regex_error (regex_constants::error_type __ecode)`

5.3 Error Types

- enum `std::regex_constants::error_type` {
`_S_error_collate`, `_S_error_ctype`, `_S_error_escape`, `_S_error_backref`,
`_S_error_brack`, `_S_error_paren`, `_S_error_brace`, `_S_error_badbrace`,

6.282.1 Detailed Description

Runtime settings and tuning parameters, heuristics to decide whether to use parallelized algorithms. This file is a GNU parallel extension to the Standard C++ Library.

6.282.2 parallelization_decision

The decision whether to run an algorithm in parallel.

There are several ways the user can switch on and __off the parallel execution of an algorithm, both at compile- and run-time.

Only sequential execution can be forced at compile-time. This reduces code size and protects code parts that have non-thread-safe side effects.

Ultimately, forcing parallel execution at compile-time makes sense. Often, the sequential algorithm implementation is used as a subroutine, so no reduction in code size can be achieved. Also, the machine the program is run on might have only one processor core, so to avoid overhead, the algorithm is executed sequentially.

To force sequential execution of an algorithm ultimately at compile-time, the user must add the tag `gnu_parallel::sequential_tag()` to the end of the parameter list, e. g.

```
std::sort(__v.begin(), __v.end(), __gnu_parallel::sequential_tag());
```

This is compatible with all overloaded algorithm variants. No additional code will be instantiated, at all. The same holds for most algorithm calls with iterators not providing random access.

If the algorithm call is not forced to be executed sequentially at compile-time, the decision is made at run-time. The global variable `__gnu_parallel::_Settings::algorithm_strategy` is checked. It is a tristate variable corresponding to:

a. `force_sequential`, meaning the sequential algorithm is executed. b. `force_parallel`, meaning the parallel algorithm is executed. c. `heuristic`

For heuristic, the parallel algorithm implementation is called only if the input size is sufficiently large. For most algorithms, the input size is the (combined) length of the input sequence(`__s`). The threshold can be set by the user, individually for each algorithm. The according variables are called `gnu_parallel::_Settings::[algorithm]_minimal_n`.

For some of the algorithms, there are even more tuning options, e. g. the ability to choose from multiple algorithm variants. See below for details.

Definition in file [settings.h](#).

6.282.3 Define Documentation

6.282.3.1 `#define _GLIBCXX_PARALLEL_CONDITION(__c)`

Determine at compile(?) -time if the parallel variant of an algorithm should be called.

Parameters

`__c` A condition that is convertible to bool that is overruled by `__gnu_parallel::_Settings::algorithm_strategy`. Usually a decision based on the input size.

Definition at line 95 of file [settings.h](#).

6.283 `shared_ptr.h` File Reference

Classes

- class [std::enable_shared_from_this<_Tp>](#)
Base class allowing use of member function `shared_from_this`.
- struct [std::hash<shared_ptr<_Tp>>](#)
`std::hash` specialization for `shared_ptr`.

- struct `std::owner_less< shared_ptr< _Tp > >`
Partial specialization of `owner_less` for `shared_ptr`.
- struct `std::owner_less< weak_ptr< _Tp > >`
Partial specialization of `owner_less` for `weak_ptr`.
- class `std::shared_ptr< _Tp >`
A smart pointer with reference-counted copy semantics.
- class `std::weak_ptr< _Tp >`
A smart pointer with weak semantics.

Namespaces

- namespace `std`

6.298.1 Detailed Description

This is an internal header file, included by other library headers. You should not attempt to use it directly.

Definition in file [std_algobase.h](#).

6.299 `std_bvector.h` File Reference

Classes

- struct [std::hash<::vector< bool, _Alloc > >](#)
[std::hash](#) specialization for `vector<bool>`.
- class [std::vector< bool, _Alloc >](#)
A specialization of `vector` for booleans which offers fixed time access to individual elements in any order.

Namespaces

- namespace [std](#)

Typedefs

- typedef unsigned long [std::_Bit_type](#)

6.301.1 Detailed Description

This is an internal header file, included by other library headers. You should not attempt to use it directly.

Definition in file [stl_deque.h](#).

6.301.2 Define Documentation

6.301.2.1 `#define _GLIBCXX_DEQUE_BUF_SIZE`

This function controls the size of memory nodes.

Parameters

size The size of an element.

Returns

The number (not byte size) of elements per node.

This function started off as a compiler kludge from SGI, but seems to be a useful wrapper around a repeated constant expression. The **512** is tunable (and no other code needs to change), but no investigation has been done since inheriting the SGI code. Touch `_GLIBCXX_DEQUE_BUF_SIZE` only if you know what you are doing, however: changing it breaks the binary compatibility!!

Definition at line 82 of file `stl_deque.h`.

6.304.1 Detailed Description

This is an internal header file, included by other library headers. You should not attempt to use it directly.

This file implements `reverse_iterator`, `back_insert_iterator`, `front_insert_iterator`, `insert_iterator`, `__normal_iterator`, and their supporting functions and overloaded operators.

Definition in file [std_iterator.h](#).

6.305 `std_iterator_base_funcs.h` File Reference

Namespaces

- namespace [std](#)

Functions

- `template<typename _InputIterator, typename _Distance >`
`void std::advance (_InputIterator &__i, _Distance __n, input_iterator_tag)`
- `template<typename _BidirectionalIterator, typename _Distance >`
`void std::advance (_BidirectionalIterator &__i, _Distance __n, bidirectional_iterator_tag)`

`traits<_BidirectionalIterator>::difference_type __n=1)`

6.305.1 Detailed Description

This is an internal header file, included by other library headers. You should not attempt to use it directly.

This file contains all of the general iterator-related utility functions, such as [distance\(\)](#) and [advance\(\)](#).

Definition in file [stl_iterator_base_funcs.h](#).

6.306 stl_iterator_base_types.h File Reference

Classes

- struct [std::__iterator_traits<_Iterator, bool>](#)
Traits class for iterators.
- struct [std::bidirectional_iterator_tag](#)
Bidirectional iterators support a superset of forward iterator /// operations.
- struct [std::forward_iterator_tag](#)

Forward iterators support a superset of input iterator operations.

- struct `std::input_iterator_tag`
Marking input iterators.
- struct `std::iterator<_Category, _Tp, _Distance, _Pointer, _Reference>`
Common iterator class.
- struct `std::iterator_traits<_Tp*>`
Partial specialization for pointer types.
- struct `std::iterator_traits<const _Tp*>`
Partial specialization for const pointer types.
- struct `std::output_iterator_tag`
Marking output iterators.
- struct `std::random_access_iterator_tag`
Random-access iterators support a superset of bidirectional /// iterator operations.

Namespaces

- namespace `std`

Functions

- template<typename `_Iter`>
`iterator_traits<_Iter>::iterator_category` `std::__iterator_category` (`const _Iter` &)

6.306.1 Detailed Description

This is an internal header file, included by other library headers. You should not attempt to use it directly.

This file contains all of the general iterator-related utility types, such as `iterator_traits` and `struct iterator`.

Definition in file `std_iterator_base_types.h`.

6.307 `std_list.h` File Reference

Classes

- class `std::_List_base< _Tp, _Alloc >`
See `bits/stl_deque.h`'s `_Deque_base` for an explanation.
- struct `std::_List_const_iterator< _Tp >`
A `list::const_iterator`.
- struct `std::_List_iterator< _Tp >`
A `list::iterator`.
- struct `std::_List_node< _Tp >`
An actual node in the list.
- struct `std::_List_node_base`
Common part of a node in the list.
- class `std::list< _Tp, _Alloc >`
A standard container with linear time access to elements, and fixed time insertion/deletion at any point in the sequence.

Namespaces

- namespace `std`

Functions

- `template<typename _Val >`
`bool std::operator!= (const _List_iterator< _Val > &__x, const _List_const_iterator< _Val > &__y)`

6.315.1 Detailed Description

This is an internal header file, included by other library headers. You should not attempt to use it directly.

Inclusion of this file has been removed from all of the other STL headers for safety reasons, except `std_utility.h`. For more information, see the thread of about twenty messages starting with <http://gcc.gnu.org/ml/libstdc++/2001-01/msg00223.html>, or http://gcc.gnu.org/onlinedocs/libstdc++/faq.html#faq.ambiguous_overloads

Short summary: the `rel_ops` operators should be avoided for the present.

Definition in file [std_relops.h](#).

6.316 `std_set.h` File Reference

Classes

- class [std::set< _Key, _Compare, _Alloc >](#)
A standard container made up of unique keys, which can be retrieved in logarithmic time.

Namespaces

- namespace [std](#)

Functions

- `template<typename _Key, typename _Compare, typename _Alloc >`
`bool std::operator!= (const set< _Key, _Compare, _Alloc > &__x, const set< _Key, _Compare, _Alloc > &__y)`
- `template<typename _Key, typename _Compare, typename _Alloc >`
`bool std::operator< (const set< _Key, _Compare, _Alloc > &__x, const set< _Key, _Compare, _Alloc > &__y)`
- `template<typename _Key, typename _Compare, typename _Alloc >`
`bool std::operator<= (const set< _Key, _Compare, _Alloc > &__x, const set< _Key, _Compare, _Alloc > &__y)`
- `template<typename _Key, typename _Compare, typename _Alloc >`
`bool std::operator== (const set< _Key, _Compare, _Alloc > &__x, const set< _Key, _Compare, _Alloc > &__y)`

- `template<typename _Key , typename _Compare , typename _Alloc >`
`bool std::operator> (const set< _Key, _Compare, _Alloc > &__x, const set<`
`_Key, _Compare, _Alloc > &__y)`
- `template<typename _Key , typename _Compare , typename _Alloc >`
`bool std::operator>= (const set< _Key, _Compare, _Alloc > &__x, const set<`
`_Key, _Compare, _Alloc > &__y)`
- `template<typename _Key , typename _Compare , typename _Alloc >`
`void std::swap (set< _Key, _Compare, _Alloc > &__x, set< _Key, _Compare,`
`_Alloc > &__y)`

6.316.1 Detailed Description

This is an internal header file, included by other library headers. You should not attempt to use it directly.

Definition in file [stl_set.h](#).

6.317 `stl_stack.h` File Reference

Classes

- class [std::stack< _Tp, _Sequence >](#)
A standard container giving FILO behavior.

Namespaces

- namespace [std](#)

Functions

- `template<typename _Tp , typename _Seq >`
`bool std::operator!= (const stack< _Tp, _Seq > &__x, const stack< _Tp, _Seq`
`> &__y)`
- `template<typename _Tp , typename _Seq >`
`bool std::operator< (const stack< _Tp, _Seq > &__x, const stack< _Tp, _Seq`
`> &__y)`
- `template<typename _Tp , typename _Seq >`
`bool std::operator<= (const stack< _Tp, _Seq > &__x, const stack< _Tp, _Seq`

### 6.334.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Contains two exception-generating types (`throw_value`, `throw_allocator`) intended to be used as value and allocator types while testing exception safety in templated containers and algorithms. The allocator has additional log and debug features. The exception generated is of type `forced_exception_error`.

Definition in file [throw\\_allocator.h](#).

bool [\\_\\_gnu\\_cxx::\\_\\_is\\_null\\_pointer](#) (\_Type)

### 6.342.1 Detailed Description

This file is a GNU extension to the Standard C++ Library.

Definition in file [type\\_traits.h](#).

## 6.343 type\_utils.hpp File Reference

### Namespaces

- namespace [\\_\\_gnu\\_pbds](#)

### Defines

- #define `PB_DS_STATIC_ASSERT(UNIQUE, E)`

### Typedefs

- typedef [std::tr1::integral\\_constant](#)< int, 0 > `__gnu_pbds::detail::false_type`
- typedef [std::tr1::integral\\_constant](#)< int, 1 > `__gnu_pbds::detail::true_type`

### 6.343.1 Detailed Description

Contains utilities for handling types. All of these classes are based on Modern C++ by Andrei Alexandrescu.

Definition in file [type\\_utils.hpp](#).

## 6.344 typeinfo File Reference

### Classes

- class [std::bad\\_cast](#)  
*Thrown during incorrect typecasting.  
If you attempt an invalid `dynamic_cast` expression, an instance of this class (or something derived from this class) is thrown.*
- class [std::bad\\_typeid](#)  
*Thrown when a `NULL` pointer in a `typeid` expression is used.*
- class [std::type\\_info](#)

*Part of RTTI.*

## Namespaces

- namespace [std](#)

## Defines

- #define `__GXX_MERGED_TYPEINFO_NAMES`
- #define `__GXX_TYPEINFO_EQUALITY_INLINE`

## Functions

- `size_t std::_Hash_bytes` (const void \*\_\_ptr, size\_t \_\_len, size\_t \_\_seed)

### 6.344.1 Detailed Description

This is a Standard C++ Library header.

Definition in file [typeinfo](#).

## 6.345 typelist.h File Reference

### Namespaces

- namespace [\\_\\_gnu\\_cxx](#)

### 6.360.1 Detailed Description

This is a Standard C++ Library header.

Definition in file [valarray](#).

## 6.361 valarray\_after.h File Reference

### Namespaces

- namespace [std](#)

### Defines

- #define **\_DEFINE\_EXPR\_BINARY\_FUNCTION**(\_Fun, \_UFun)
- #define **\_DEFINE\_EXPR\_BINARY\_OPERATOR**(\_Op, \_Name)
- #define **\_DEFINE\_EXPR\_UNARY\_FUNCTION**(\_Name, \_UName)
- #define **\_DEFINE\_EXPR\_UNARY\_OPERATOR**(\_Op, \_Name)

### Functions

- template<class \_Dom >
